- verticals over REAL ground
- a simple approach to GOES reception
- EMI/RFI shielding
- V-antenna for two meters
- wide-range ohmmeter
ICOM is proud to announce the latest in 440MHz handheld transceiver technology. The IC-04AT represents the best in a multifunction, multifrequency handheld for 440 - 450 MHz.

Features. The IC-04A and IC-04AT cover from 440 - 449.995 MHz. Frequency entry, control functions and the 32 PL tones are controlled by the 10-button pad on the face of the radio. Also included are priority, scanning (both of memories and programmable band scan) and DTMF (only). For scanning, 5, 10, 15, 20, or 25 kHz increments are front panel selectable. Ten memories with internal lithium battery backup give the ultimate in flexibility for channelizing operation of this sophisticated handheld for easy access to most used channels. Thus, the IC-04A(T) may be used to individually bring up any frequency between 440 and 449.995 MHz with 5 kHz spacing, or favorite frequencies may be stored in the memory and recalled at the touch of a button. The IC-04A(T) has all the features you could want in a handheld.

Compatible Accessories. The IC-04A(T) has the same styling, control features and functions of the IC-02A(T). The IC-04AT utilizes the existing accessory line available for the IC-2A and IC-2AT, plus new accessories such as long-life and high-power battery packs and a boom headset. Multiple battery packs allow the widest flexibility in charging: either from a wall charger, cigarette lighter plug, stand-up desk charger, or through the top of the radio. Twelve volts applied through the top of the radio not only provides operation of the radio at high power, but provides charging of the battery packs at the same time — a feature not commonly found in handheld units.

Built to Last. The IC-04A(T) comes with a sealed case, providing resistance to moisture, dust, and other elements detrimental to the operation of the radio. An aluminum back provides a massive heatsink for the power module allowing the IC-04A(T) to run at a standard 3 or 10 watts (optional battery required). A battery lock is provided to ensure the battery will remain secure, and the unit will continue to operate even if mishandled. A custom LCD readout with meter is unique to the ham industry.

Expanding on our line of available accessories, the IC-04A and IC-04AT become the most versatile handhelds in their class. See the IC-04A(T) at your nearest ICOM dealer.

ICOM America, Inc., 2112-116th Ave NE, Bellevue, WA 98004 (206) 454-8155 / 3331 Towerwood Drive, Suite 307, Dallas, TX 75234 (214) 620-2727

All stated specifications are approximate and subject to change without notice or obligation. All ICOM radios significantly exceed FCC regulations limiting spurious emissions.
Food for thought.

Our new Universal Tone Encoder lends its versatility to all tastes. The menu includes all CTCSS, as well as Burst Tones, Touch Tones, and Test Tones. No counter or test equipment required to set frequency—just dial it in. While traveling, use it on your Amateur transceiver to access tone operated systems, or in your service van to check out your customers’ repeaters; also, as a piece of test equipment to modulate your Service Monitor or signal generator. It can even operate off an internal nine volt battery, and is available for one day delivery, backed by our one year warranty.

- All tones in Group A and Group B are included.
- Output level flat to within 1.5db over entire range selected.
- Separate level adjust pots and output connections for each tone Group.
- Immune to RF
- Powered by 6-30vdc, unregulated at 8 ma.
- Low impedance, low distortion, adjustable sinewave output, 5v peak-to-peak
- Instant start-up.
- Off position for no tone output.
- Reverse polarity protection built-in.

BIG performance... small size... smaller price!!!

TR-2500

The TR-2500 is a compact 2 meter FM handheld transceiver featuring an LCD readout, 10 channel memory, lithium battery memory back-up, memory scan, programmable automatic band scan, Hi/Lo power switch and built-in sub-tone encoder.

TR-2500 FEATURES:
- Extremely compact size and light weight
- LCD digital frequency readout
  Shows frequencies and memory channels, four “Arrow” indicators.
- Ten channel memory
  Nine memories for simplex or ±600 kHz offset, “MO” memory for non-standard split frequency repeaters.
- Lithium battery memory back-up
  (Estimated 5 year life) Maintains memory when Ni-Cd pack is fully discharged or removed.

- HI/LOW power selection
  2.5 watts or 300 mw.
- Memory scan
  Scans only channels in which frequency data is stored.
- Programmable automatic band scan
  Upper and lower frequency limits and scan steps of 5-kHz and larger.
- UP/DOWN manual scan
- Built-in tuneable sub-tone encoder
  Tuneable (variable resistor) to desired CTCSS tone.
- Built-in 16-key autopatch encoder
  *SLIDE-LOC* battery pack
- Repeater reverse switch
- Keyboard frequency selection
- Extended frequency coverage
  Covers 143.900 to 148.995 MHz in 5-kHz steps.
- Optional power source
  Using optional MS-1 mobile or ST-2 AC charger/power supply, radio may be operated while charging. (Automatic drop-in connections.)

Actual size
- High impact plastic case
- Battery status indicator
- Two lock switches
  Prevent accidental frequency change and accidental transmission.

Standard accessories include:
- Flexible antenna with BNC connector
- 400 mAH Ni-Cd battery pack
- AC charger
- Optional accessories:
  - ST-2 Base station power supply/charger (approx. 1 hr.)
  - MS-1 13.8 VDC mobile stand/charger/power supply

TR-3500

70 CM FM Handheld
- 440-449.995 MHz in 5-kHz steps
- TX OFFSET switch keyboard programmable ±6 kHz to ±9.995 MHz
- 1.5 W/300 mW Hi/LO power switch
- Auto, squelch position on squelch control
- Tone switch for TU-35B optional programmable CTCSS encoder
- Other features include 10 memory lithium battery memory back-up, programmable automatic band scan, memory scan, UP/DOWN manual scan, repeater reverse, 16-key autopatch, keyboard frequency selection, slide-lock battery

- VB-2530 2-M 25 W RF power amp. w/cables, mgt. brkt. (TR-2500 only)
- TU-1 Programmable CTCSS encoder (TR-2500 only)
- TU-35B Programmable CTCSS encoder (mounts inside TR-3500 only)
- PB-25 Extra 400 mAH Ni-Cd battery
- PB-25H Heavy-duty 490 mAH Ni-Cd battery
- DC-2S 13.8 VDC adapter.
- BT-1 Battery case for manganese/alkaline AA cells
- SMC-25 Speaker-microphone
- LH-2 Deluxe leather case
- BH-2A Belt hook
- RA-3 m 3/8X telescoping antenna (for TR-2500).
- WS-1 Wrist strap
- EP-1 Earphone

More information on the TR-2500 and TR-3500 is available from all authorized dealers of Trio-Kenwood Communications, 1111 West Walnut Street, Compton, California 90220.

COVER: Siliconix, Inc.
Lost Weekend

With winter rapidly approaching, this past weekend was supposed to be spent cutting, splitting, and stacking wood for our stoves; operating for a few hours in the contest (CQ WW CW); and compiling the results of the last few questions of the September reader survey. Who could predict that my high tree-supported wire antennas would be belted with almost nonstop gusty winds and twice need repair — and a five-band trap vertical need a midnight pruning? I didn’t count the number of times I ran back and forth from the shack to the vertical, but it numbered in the scores. (There wasn’t much difference in temperature between the bitter cold outside and the shack . . . I hadn’t yet cranked up the stove.)

After relaxing from the contest, I looked forward to leisurely compiling the thoughtful responses to the question that asked readers to tell us how they thought ham radio might be improved.

I read each and every answer to that question at least twice. Many comments were just what we’d expected. While some were indeed eye-opening, none were shocking. Here’s what I found:

About your Amateur interest. The average reader of ham radio holds at least an Advanced class license (Extra, 33 percent; Advanced, 39 percent; General, 16.5 percent; Technician, 7 percent; Novice, 1.4 percent; no license, 1.4 percent) and has been licensed for 19 years. (33 readers in our sample have each been licensed for over 51 years.)

You operate mostly on SSB/AM. (CW and FM modes are just about tied for second place.) More than half the time you spend on 80 through 10, though the VHF bands attract the second largest group. A little over half of you build your own equipment; considering the level of interest indicated in construction articles, probably more of you would like to. Of those who build, half build from kits and half from "scratch."

How does this translate into hours spent on all facets of Amateur Radio? According to our poll, half our readers spend at least ten hours per week in operation or related activities.

Over half of you own personal computers. And of the half that don’t, a third plan to purchase one within the coming year. What isn’t clear is how many of you who own computers use them in Amateur Radio applications. (Let us know.)

About ham radio. What do readers want from us? Specifically, you asked for more articles on antennas (the #1 favorite subject overall), receivers, and using computers for Amateur Radio. There was a general request — almost across the board — for more construction articles, and almost as much interest in articles of a more theoretical nature. Many different subjects attracted your attention (not surprising in view of your diversified backgrounds, occupations, and interests); we’ll use this information to plan future issues.

To which magazines do your subscribe? ham radio, of course (98.5 percent, and to a lesser extent, the three other brand names. (This comes as no surprise, considering that it was our readership that was polled.)

Which best suits your needs? This question really brought out the diversity of our readership. No, you don’t think that ham radio is tops in terms of reporting on station activities, contesting, politics, news stories, or nostalgia. You buy the other books for that. That’s fine. We at ham radio aren’t trying to be a something-for-everybody magazine. We’re just trying to provide the best technical ham magazine you can obtain. That has always been our charter.

I want to thank all who responded, and especially the hundreds of readers who took the time to expand their views in additional comments and even lengthy letters. (One reader even sent an hour-long audio tape.) The quantity and quality of positive suggestions supplied would be highly gratifying to any editor; as the months and years unfold, I’ll do my best to put your advice to work. One major reader request has already been incorporated: starting in this issue, Joe Reisert, W1JR, will contribute a monthly column on VHF/UHF. Joe’s many technical and operating accomplishments should be of interest to old and new readers alike.

As this issue went to press, we heard of the untimely passing of Vic Clark, W4KFC, President of the ARRL, over the Thanksgiving weekend. To me, Vic personified Amateur Radio. He was a dedicated ham, a kind person who was always thinking of ways to improve the hobby. He will be missed.

Rich Rosen, K2RR
Editor-in-Chief

6 January 1984
Let's you send and receive computerized RTTY/ASCII/CW. Copies all shifts and all speeds. Copies on both mark and space. Sharp 8 Pole active filter for 170 Hz shift and CW. Plugs between your rig and VIC-20, Apple, TRS-80C, Atari, TI-99, Commodore 64 or most other personal computers.

Uses MFJ, Kantronics software and most other RTTY/CW software.
ARRL President Vic Clark, W4KFC, passed away suddenly November 25. He had complained of chest pains Thanksgiving day, and went to the hospital for examination. He seemed to be doing OK, but was in the hospital for observation Friday night when a sudden heart attack claimed him. Vic had suffered some health problems in the past few years.

Vic, a "Ham's Ham," served Amateur Radio with distinction for most of his life. He had been an ARRL director, played key roles on FCC/Amateur advisory committees, and in various international Amateur Radio Union activities, yet always found time to get on the air. A top CW contest operator and DXer, W4KFC's call was for many years invariably found among the top scores in the Sweepstakes and DX frays. Just a week before his death Vic was made a Fellow of the Radio Club of America, "for leadership in Amateur Radio organization, including WARC preparation and implementation." When a League director recently expressed concern that Vic was pushing himself too hard he replied that he wouldn't feel he'd done his part if he didn't die "in the saddle."

Memorial services were held November 30 in Washington, DC; contributions in Vic's memory can be made to the ARRL Foundation c/o ARRL. He's survived by his wife, Hester, W4APAE, and six children, three of them also amateurs. W4KFC, a silent key at 66.

New ARRL president is Carl Smith, W8ORJ, as automatically provided by the League By-Laws. Succeding Carl is Vice President Vic Belfield, W4RA, who learned aerial gunnery from Lt. Barry Goldwater back in 1940. Carl is well known and respected in both domestic and international Amateur circles. His work on the 1979 WARC also led to constructive working relationships with key people at the FCC, as well. No radical changes in ARRL direction are expected under Carl's direction.

ARRL's wish for VEC compensation was answered when the House and Senate passed the FCC Authorization (funding) bill just before Thanksgiving. Smooth political maneuvering by Senator Barry Goldwater, who reversed his earlier opposition to any fees in the program, resulted in the fee-permitting amendment being attached to the FCC bill. It was then passed without dissent. FCC Chairman Fowler also supported the pro-fee change.

ARRL can now proceed to develop its own VEC role; its Executive Committee had put its program on hold pending outcome of the fee question. However, it could still be some time before fees are actually incorporated into the rules. With such delicate questions as fee allocation and acceptable accounting procedures unanswered, the Commission will probably decide the formal rules--not just a matter of fee--in coming months.

In the meantime a number of other organizations including educational institutions have expressed their interest in becoming VECs. It now appears a distinct possibility that, at least in some areas, we could end up with more than one VEC!

10-meter repeaters will remain limited to 29.5-29.7 MHz, at least for the immediate future. Acting on PR Docket 83-485, the Commission decided the interference potential with satellite downlinks and other 10 meter users was too great to justify any change. The ARRL, which initially supported expansion, had filed against any change at this time pending results of the further Notice of Proposed Rule Making on phones and expansion above 29 MHz. However, the expansion on phones has been pushed to The Back Burner, with current FCC resources occupied with the volunteer exam program, Amateur involvement in rules enforcement, and of course the "No-Code" license. Latest Washington readings indicate action on the no-code license is very close, possibly as a "Christmas present" to the Amateur community.

W5LFL did get on the air from the Space Shuttle, with a full-quieting signal into a hand-held and rubber ducky. At press time the first confirmed QSO was WAIJXN/7 in Montana on orbit 40, though he may also have worked the West Coast on an earlier pass. Lots of media exposure has also been reported. QSL and SWL cards should go c/o ARRL with an SASE.

Pressure on the 220-MHz band is still increasing, with the FCC's Office of Science and Technology now suggesting that the 220-225 MHz allocation be the subject of an FCC Notice of Proposed Rule Making. Though Amateurs are currently the sole users, the band is actually shared with government and land mobile on a co-prime basis.

Band usage could be the principal delimiting factor of its future, both in quantity and quality. One way that might help preserve the band would be to make it Amateur Radio's prime high tech "workplace," with, for example, packet radio and various wideband techniques. This is one of the approaches the ARRL is planning to take.

W86JAC's conviction for transmitting obscenity on the Amateur bands has been reversed in the U.S. Ninth District Court of Appeals. Though the court did not dispute that Burton had transmitted "obscene" language, it said the government prosecutors had failed to show his actions aroused any "prurient interests!" His convictions for operating without a license still stand. However, such cases may be easier to sustain in the future, as other amendments to the FCC Authorization Bill extend Commission authority over "Dial-A-Porn" telephone businesses since their content is potentially available to children, and that's justification for not providing it First Amendment protection. Since Amateur Radio is operated primarily in homes or family automobiles, the same sanctions could be applied.

Rick Cooper, the former Exponent Of Unlicensed "HF" Operation, has surfaced again as a result of the Burton reversal. In a rambling letter to the Amateur Radio media, he and his "Communications Attorney Service" promised to support Burton in a lawsuit against "...ARRL, FCC and all radio hams who conspired to deprive Mr. Burton of his constitutional rights...."
OWN THE WORLD WITH THE R3
NO RADIAL VERTICAL
10, 15, 20 METERS

The R3 half wavelength design eliminates the ground radial system required by other verticals. Optimum current distribution gives more efficiency and low angle radiation for DX communications.

R3 brings high performance antenna features to those living in apartments, condominiums or on small city lots. Even if you have plenty of space, R3's combination of neat appearance and DX capability make it ideal for your station. The R3 includes an integral tuner to give a perfect match across 10, 15, and 20 meters. The remote tuning feature allows easy fingertip control as you operate your station.

R3 is a complete antenna system ready to install in virtually any location from ground level to roof top.

FEATURES
- 3 dB Gain, ref 1/4 whip
- No Radials
- 360° Coverage
- Integral Tuner with Remote Control Console and Indicator
- 24 Volts To Tuner
- 110 or 220 Volt Operation
- 75 ft (22.9m) Control Cable included
- Only 22 ft (6.7m) High
- 1 sq ft (.09 sq m) Space
- Self Supporting
- Stainless Steel Hardware
- Mount: Sleeve Type Fits Pipe Up To 1½ in (4.5cm) dia
- Can Be Easily Stored and Set Up For Portable or Temporary Operation

Add up the features—you’ll find that you can have ALL OF THIS PERFORMANCE without the need to buy tower, rotator and associated hardware. R3 IS ANOTHER PRODUCT CREATED FOR THE ENJOYMENT OF YOUR HOBBY BY THE WORLD RENOWNED CUSHCRAFT ENGINEERING DESIGN TEAM.

THE ANTENNA COMPANY

AVAILABLE THROUGH DEALERS WORLDWIDE
High linear power and gain

NEL1306
- \( P_{1dB} = 38 \text{ dBm typ.} \)
- \( G_{1dB} = 7.5 \text{ dBm typ.} \)

NEL1320
- \( P_{1dB} = 43 \text{ dBm typ.} \)
- \( G_{1dB} = 6.0 \text{ dBm typ.} \)

- 13.5 volt operation
- Pt-Si/Ti/Pt/Au metallization system
- Emitter ballasting
- Silicon nitride passivation

From our latest line of NPN epitaxial power transistors, NEC now introduces the NEL1300 range of linear power bipolar devices. The series is available in a low cost metal-ceramic stripline package offering linear power output levels of 6 watts and 20 watts. Designed primarily for mobile and base station operation in the 1300 MHz band, the series is compatible with single sideband and other popular modulation modes requiring high linearity combined with high output power and gain.
comments

10-meter beacon
Dear HR:

The 10-meter beacon described in the September, 1983 issue of ham radio ("Comments," page 13) has been moved from Niantic, Connecticut, to just outside of Rochester, New York. It is now about 10 miles (16 km) south of Rochester at 43°02' N, 77°41' W, in grid square FN 13 using the Maidenhead Grid Locator system. The power is still 4 watts output and the antenna is a dipole up about 20 feet (6 meters). The beacon, on 28.286 MHz CW, is on the air 24 hours a day.

W. Keith Hibbert, KA1YE
Rush, New York

TOM remembered
Dear HR:

I read your "Reflections" column in October, 1983, ham radio. I don't think I've ever been so pleased to read anything in Amateur Radio publications.

I was fortunate. I read "TOM" early in my exposure to Amateur Radio. Whenever a bad practice would make an appearance, TOM would be there with the way to get back on the track. It seemed that all Amateurs had tremendous respect for TOM, and as a result, he had a tremendous effect upon the behavior of the majority of licensed operators.

As I remember, I was perhaps one of the first to complain about lists. I wrote to — was his name Newkirk? — the DX editor of QST at the time and registered my protest against what I perceived to be a cancer growing on DXCC. Of course, nothing happened except that as time passed, DXCC became less of an accomplishment. Naturally, if the real competition is removed from DXCC (or any other award), the award becomes less desirable to the true DXer. I wonder what sense of accomplishment one receives from Honor Roll status when he knows that the certificates should be made out in the name of the do-good MC?

I am proud of my DXCC, 5B DXCC, WAZ, etc. I have 308 confirmed and every last one is self-earned! To disprove the equipment dodge, I have only modest equipment, but it has been put together with DX in mind, using a tri-band beam. But I expect that if one wants to work DX, he must equip himself with DX gear just as an automobile racer equips himself. (I don't ever remember TOM saying it was wrong to run legal power — or to use gain antennas.)

With the MC type of DX, you stand in line and take your turn! This should never have been allowed to happen. I blame all of the DX commentators for forgetting that DX is a competition and that the chase is where the fun is. I'm very pleased that ham radio has brought the issue out of the closet. Perhaps continued exposure of this practice will make it dry up and disappear. If it is ridiculed sufficiently — and often — I feel sure that many Amateurs will avoid it, and in so doing regain the thrill of DXing.

Walter Camuso, W1ESN
Vero Beach, Florida

avoiding splatter
Dear HR:

W5XW's excellent letter (December, 1983) commenting on the poor waveform of the sidetone of some keyers is correct. A poor waveform would cause splatter if fed into the audio input of a transmitter. My own homebrewed circuit uses a Twin-T audio oscillator and produces a good waveform output that has been checked on an oscilloscope. And my on-the-air tests have shown that there was far less interference caused than when you yell AHHHHHHH into the microphone, or the side bands caused by normal conversation. I did check on a buddy's commercial keyer's sidetone, and it was poor, just as Bob said.

The relay technique I described was not used in the audio input circuit, but was used in the keying circuit because the frequency of the relay was far too low for a good audio signal. It acted just like the dots of my old Vibroplex, when I tested the idea years ago. And as I said, I did prefer the automatic keyer because it gave a steadier output, as would be expected.

The low-duty cycle technique, used with a dummy load, is very effective when tuning up because before you tune for your plate current dip, your plate dissipation can temporarily be quite high, and at times reach dangerous levels. Another good reason for first using a proper dummy load is that when your final amplifier is tuned up, you don't have to touch its controls when you switch to your antenna tuner. This technique naturally eliminates the interaction problem between transmitter and tuner controls that is so often present when you tune up directly without first using a dummy load. The more you use your dummy load, the less QRM you make on the bands.

So to avoid splatter as mentioned by W5XW, do as he suggests, unless your audio side tone output is a good sine wave; just use dots and key your transmitter directly. (And thanks, Bob, for your precautionary letter. I had not been aware of the poor quality of sidetone wave shapes of the kind of units he discussed until he brought it to my attention.)

William Vissers, K4KI
Cocoa Beach, Florida
power FETs: trend for VHF amplifiers

Use these MOSFETS for better thermal stability, lower noise, easier matching, and higher voltage operation

The dull black fins of heatsinks have all but replaced the glow of vacuum tubes as the distinguishing visual feature of power amplifiers designed for Amateur use. Bipolar junction power transistors offer many advantages and have, among amplifier designers, become the device of choice over vacuum tubes in many applications. However, just as bipolar junction transistors have largely replaced vacuum tubes as technology has advanced, it now appears that bipolar transistors are being challenged by field effect transistors (specifically RF power MOSFETs) in the RF power amplifier field.

In this article we will discuss some of the features that make the RF power MOSFET (variously known as VMOS, TMOS, DMOS, etc. by different manufacturers) an impressive RF power amplifier. We will also touch on some of the problems that accompany their use. Measurements made on several actual VHF mobile power amplifiers will serve to illustrate the discussion. The amplifiers examined are 50 and 100 watt 2-meter units and a 100 watt unit for 220 MHz.

Advantages

When compared to conventional bipolar transistors, the RF power MOSFET offers the following advantages:

Thermal stability. The current gain (Beta) of a typical bipolar transistor increases with temperature. As a result, the collector current can increase with temperature, which results in still higher temperatures and even higher currents, and can lead to thermal runaway. Careful circuit design is required to prevent this problem. On the other hand, at high power levels the transconductance of a power FET decreases with temperature, and an increase in temperature results in a decrease in current, which tends to be self-stabilizing. This stabilization also applies across the chip and serves to prevent destructive phenomena characteristic of a bipolar device: current hogging, hot spotting, and secondary breakdown. Also, no internal source ballasting resistors — with their inherent gain reduction, increased parasitic capacitance, and increased fabrication costs — are required.

Another advantage of this temperature characteristic is the ability to parallel several power FETs without the need for careful device matching. With VHF amplifiers, the number of devices that can be paralleled is limited more by the physical problem of additional parasitic reactances than anything else.

Low noise. A power FET generates far less broadband noise, typically 10 dB better, than a comparable bipolar transistor. This is due partially to the absence of a forward-biased junction and its associated shot noise. This low noise has the potential for significant reduction of transmitter noise levels, which can be beneficial at repeater sites or at any location where other equipment is operating in close proximity.

Low spurious. The transfer characteristic of a typical power FET displays no abrupt changes in shape. This means that when biased for Class AB operation, as in a typical linear power amplifier application, there will be lower high-order inter-
This translates into smooth tuning of the input and output, along with continuous input/output curves, and contrasts with bipolar devices that tend to require retuning at each power level. Bipolar devices also tend to have jumps in power output due to parameters changing with power level.

**Simplified circuit design.** Gate leakage current is in the nanoampere or sub-nanoampere range resulting in essentially no bias power being used. Thus, simple, low-power bias circuits can be utilized. In addition, the negative temperature coefficient of the FET allows the use of bias supplies without the complex temperature compensation schemes common to bipolar designs. In some higher power designs, it is still desirable to use temperature compensation. However, the compensation is to reduce variations in circuit performance with temperature, not to protect the devices.

**Higher operating voltage.** Although the practical circuits we will consider in this article are oriented toward mobile VHF power amplifiers, the newer high voltage FETs reaching the market present exciting possibilities for base station use. As supply voltage increases, current decreases and impedance levels increase. At a fixed power level, doubling the voltage halves the current and quadruples the impedance. Increased impedance reduces the effect of parasitic inductance elements and makes the internal leads of the transistor a less critical part of the matching networks. Capacitor values in the matching networks become more reasonable and bypassing gets much easier. Finally, increased impedance allows easier broadband transformer design.

**Ruggedness.** The previously discussed thermal properties of the FET are often mentioned as the reason for their toughness when compared to bipolar devices.

Another equally important factor contributing to this quality is the FETs' voltage ratings. For example, the gate in the Siliconix devices, specified for 13.6 volts service, will withstand at least 30 volts with respect to the source or drain, and the drain will withstand at least 45 volts with respect to the source. Devices with even higher voltage ratings are available.

The result of these high breakdown voltages and favorable temperature characteristics is an amplifier that can withstand considerable abuse. Neither reasonable amounts of excessive input power nor high VSWR loads will cause any problems for the FET.

**Commercially available RF power MOSFETS**

The preceeding discussion of the advantages of RF power MOSFETs is relevant only if you can pur-
chase the devices and actually use them in an amplifier. Table 1 lists some important parameters of a sample of the RF power MOSFETs available from Siliconix, Motorola, and Acrian, respectively. (Other manufacturers offer RF power MOSFETs, so your choice is not limited to these three. Also note that these are only partial lists, and that the selection continues to increase as time passes.)

The purpose of Table 1 is simply to illustrate the ranges of some of the devices available and to list the performance of the particular devices under certain sets of circumstances. The devices are useful under conditions other than those listed. For example, the Motorola devices specified at 28 volts perform very well, although at reduced gain and power levels, at 13.6 volts. The higher power levels listed are PEP ratings. Thermal considerations make steady-state power outputs at higher power levels impractical. Higher power levels require the paralleling of devices, fans, and other parts.

**building a test amplifier**

The Siliconix DV1260T, described in Table 1, is a particularly interesting device for use in VHF mobile power amplifiers. The rest of this article will be devoted to examining the use of this device in several practical circuits.

The first step was to build a lab model of a single-transistor 2-meter amplifier in order to verify the Siliconix data and explore possible problems in the areas of stability, DC voltages, gain, and RF matching. The design goal was a 50-watt amplifier usable for both FM and SSB.

Fig. 1, a schematic of the amplifier, reveals a straightforward approach. Both input and output matching networks use double L sections. The double L sections result in lower losses than single section networks. The input network transforms a gate impedance of 1 ohm to 50 ohms. The 1-ohm gate impedance is essentially resistive at these frequencies because the input capacity is near series resonance with the lead inductance. If done in a single L sec-

tion, a loaded $Q$ of about 10 is required. This produces a 1 dB loss for coils of reasonable $Q$. The double L section allows loaded $Q$s of about 3 and the two sections produce a loss of about 0.5 dB. Incidentally, because the input and output impedance transformations were very similar at the power level of interest, similar components were used for both networks.

Testing of the amplifier was done at supply voltages of both 13.6 and 16 volts. 16 volts was included for potential base station use because the performance of the DV1260T improved a bit at higher voltages. The amplifier was tested at 146 MHz.

An exploration of the effects of quiescent current was made. If the quiescent current is too high, the device will overheat from static dissipation. If the quiescent current is too low, gain and linearity suffer. Fig. 2 shows the gain and efficiency of the amplifier as a function of quiescent current. A quiescent current of 3 amperes was used for most of the remainder of the tests.

Fig. 3 shows the gain of the amplifier as a function of the output level. At 16 volts a gain of over 15 dB is achieved at low power levels, dropping to about 10 dB at 75 watts output. At 50 watts the gain was measured at 12.2 dB. The lower curve shows the expected decrease in gain at 13.6 volts.

Fig. 4 demonstrates the effect of output power level on efficiency. At first glance it might appear that the efficiency is greater at 13.6 volts than at 16 volts. However, we must look at the efficiencies at equivalent points with respect to maximum power output. For example, the amplifier operating at 16 volts and 75 watts has about the same gain and linearity as when operating at 13.6 volts and 50 watts and as might be expected, the efficiency at 16 volts and 75 watts is greater than for 13.6 volts and 50 watts.

Measured at 25 watts, the test amplifier showed an input VSWR of just under 2. This was with the tuning adjusted for maximum output. This value would seem adequate for working with most Amateur transceivers.

Other tests were run and the following basic conclusions were reached. The DV1260T device performed essentially as claimed by Siliconix. A single device is quite capable of 75 watts when operating at 16 volts and 50 watts when operating at 13.6 volts. Looking forward, a pair of these devices would appear to be suitable for 100 to 150 watts when operating from 16 volts. When operating from 13.6 volts, a capability of 100 watts would seem practical.

**a practical amplifier**

The next step was to take the test amplifier and turn it into a practical amplifier by adding T/R switching and control circuitry. An amplifier of this power level will be used primarily to boost the power level of the ubiquitous two-meter handheld transceiver (HT) when used in an automobile, so we added a few other features: an adjustable regulated power supply to power the HT and save on batteries, an audio amplifier to boost the HT's sound level, and provision for plugging in a receiver preamplifier. Fig. 5, a schematic of the finished unit, represents a complete handheld transceiver (HT) accessory package. Because this is not intended to be a construction article, the schematics are supplied for functional guidance only; in the interest of brevity we will describe the circuit in terms of features rather than in specific detail. We hope it will serve as a source of ideas to those of you who will design their own FET amplifiers.

The unit was built on two PC boards, an RF board,

NEW MBATEXT™

$109.95 List / $89.95* VIC-20 MBATEXT or C-64 MBATEXT

MBATEXT™ is the most advanced MBA (Morse, Baudot, ASCII) software plug-in cartridge available for the VIC-20 or Commodore 64 computer. Compare our outstanding features and price to the competition.

- KEYBOARD OVERLAY instructions to avoid constant referral to the manual
- RTTY and ASCII SPEED ESTIMATE MODE
- BREAK-IN CW MODE
- QSO BUFFER RECORD TOGGLE
- WORD PROCESSOR style insertion, deletion, and correction in TEXT EDIT MODE
- CW AUTO SPEED TRACKING plus SPEED LOCK
- BREAK-IN BUFFER that is easy to use
- Low speed FARNELLWORTH CW TRANSMISSION (beyond 5 and 14 WPM)
- RECEIVE TRANSMIT

RECEIVED TEXT DIRECTLY without need of disk or cassette
- DISK, Cassette, or PRINTER storage of message and QSO buffers
- RECEIVE AND TRANSMIT 5-99 WPM MORSE
- 10 SOFT-PARTITIONED** MESSAGE (OR TEST) BUFFERS
- WORD WRAP
- TIME OF DAY CLOCK
- PRECOMPOSE SPLIT SCREEN OPERATION
- STATUS INDICATORS on screen
- EASY START-UP by simply typing SYS 44444 or SYS 33333
- DEDICATED FUNCTION KEYS for quick operation
- Ability to IMBED CONTROL FUNCTIONS in type-ahead buffer
- WORD OR CHARACTER mode
- SELECTABLE BAUDOT UNSHIFT ON SPACE (USOS)
- SEND/RECEIVE 60, 67, 75, 100, 132 WPM BAUDOT PLUS 100, 300 BAUD ASCII
- RTTY BLANK-FILL and MORSE BT option for Idle transmit periods
- AUTOMATIC PTT
- computer control of TONE REVERSE
- MASTER MENU, COMMAND MENU, and OPTIONS MENU makes MBATEXT™ easy to use with no prior experience
- INCLUDES CABLE TO INTERFACE with AEA model CP-1 COMPUTER PATCH™
- POWERED BY HOST COMPUTER

NEW MICROPATCH™

MICROPATCH™ is a NEW LOW-COST, HIGH-PERFORMANCE Morse, Baudot and ASCII SOFTWARE/HARDWARE computer interface package. The MICROPATCH™ model MP-20 or MP-64 incorporates the complete MBATEXT software ROM (described above) for either the VIC-20 or Commodore 64 computers. All circuitry and software is incorporated on a single, plug-in cartridge module featuring the following:

- TRUE DUAL CHANNEL MARK AND SPACE MULTI-STAGE 4 POLE, CHEBYSHEV ACTIVE FILTERS
- AUTOMATIC THRESHOLD CORRECTION for good copy when one tone is obliterated by QRM or SELECTIVE FADING
- EASY, POSITIVE TUNING with TRIPLE LED INDICATOR
- NOT a low-cost, low-performance phase-locked loop detector!!!
- SWITCH SELECTED 170 Hz or WIDE SHIFT on receive
- 800 Hz multi-stage active CW FILTER
- AUTOMATIC PTT
- RTTY ANTI-SPACE
- demodulator circuitry powered by external 12VDC (not supplied) to AVOID OVERLOADING HOST COMPUTER
- for maximum EMI ISOLATION
- EXAR 2206 SINE GENERATOR for AFSK output
- SHIELDED TRANSMITTER AFSK/PTT INTERFACE CABLE PROVIDED
- PLUS or MINUS CW KEYED OUTPUT
- FSK keyed output.

The Micropatch is structured for easy upgrading to the AEA Computer Patch™ advanced interface unit without having to buy a different software package! Simply unplug the external computer interface cable (supplied with the Micropatch) from the Micropatch and plug it into the Computer Patch.

COMPUTER PATCH™

COMPUTER PATCH™ is the name of our most advanced computer interface equipment for Morse, Baudot, ASCII, or AMTOR operation. The CP-1 will allow you to patch most of the popular personal computers to your transceiver when used with the appropriate AEA SOFTWARE™ TU software such as AEA MBATEXT, AMTOR TEXT™, or the MBATEXT RESIDENT ON THE MICROPATCH units. AEA also offers a full feature software package for the Apple II, II Plus and IIE; TRS-80 Models I, III and IV; and the IBM-PC. The CP-1 will also work with certain other computers using commonly available software packages.

The CP-1 offers the following advanced and high quality features:

- HANDSOME ALL METAL ENCLOSURE FOR MAXIMUM RF IMMUNITY
- DUAL CHANNEL, MULTI-STAGE ACTIVE MARK AND SPACE FILTERS
- AUTOMATIC THRESHOLD CORRECTION
- RECEIVE 170 HZ FIXED OR 100-1000 HZ VARIABLE SHIFT
- 800 HZ multi-stage CW FILTER
- PRE-LIMITER AND POST-LIMITER FILTERS
- SERIAL RS-232 FIELD INSTALLABLE OPTION
- 117 VAC WALL ADAPTER SUPPLIED
- PLUS (+) and MINUS (-) CW OUTPUT JACKS
- MAGIC EYE STYLE BAR GRAPH TUNING INDICATOR
- SCOPE OUTPUT JACKS
- NORMAL/REVERSE front panel switch
- MANUAL (override) PTT switch
- VARIOUS THRESHOLD for CW
- ANTI-SPACE RTTY
- KEY INPUT JACK for narrow shift CW ID on RTTY, CW practice, or keyboard bypass.

The CP-1 is made in the U.S. with high quality components including double-sided glass epoxy through-hole plated boards, complete with solder mask and silk screened parts designators.

jumper across points A and B when the preamplifier microstripline on the PC board.

The preamplifier, designed especially for this project, consists of the transistor leads and a short length of sections used for the same reasons as explained in the discussion of the test amplifier, above. The inductor for the L sections next to the transistor contains the amplifier and matching networks, a TR relay, a LT121 amplifier, and a receiver preamplifier.

The five-pole output lowpass filter has a cut-off frequency of about 200 MHz. Two filter response "zeros" are introduced at about 292 MHz as second harmonic suppressors. The zeros are the result of capacitors C17 and C19. The second harmonic is more than 65 dB below the fundamental. Higher harmonics are further down and not measurable with the equipment used.

Fig. 6 is the PC board pattern for the front and back of the RF board and Fig. 7 is the parts layout.

Fig. 8 shows power output versus power input. It is a little bit less than the output of the test amplifier because of the losses in the relay and lowpass filter.

The amplifier performs smoothly. Its input/output characteristics exhibit none of the discontinuities or hysteresis common to bipolar power transistors. The tuning is very smooth and the tuning characteristics do not vary much with power level, as with bipolar transistors. Varying tuning, power level, and load VSWR while monitoring spectral output revealed no trace of spurious outputs.

The amplifier is well behaved and fully stable in any operating environment. It is possible to create oscillations by reactively terminating the input with no load on the output. This condition does not occur in normal operation.

A thermostat that opens at 175 degrees Fahrenheit is mounted on the heatsink near the amplifier transistor. Although you should always use more than adequate heatsinks to prevent overheating, there is always the possibility that even a well-protected unit might be covered by something — a carelessly thrown sweater, for example — that could cut off airflow. In such an event, in which overheating would be possible, the thermostat could prevent expensive damage.

The control/accessory board supplies the necessary switching and control circuitry for the amplifier and accessory circuits to increase the utility of the HT in the mobile environment.

An RF detector on the amplifier board supplies a voltage when the HT is keyed. This is sensed by U1B and turns on Q2 which controls the TR relay. U1B also controls U1A, which supplies a regulated voltage for biasing the amplifier. Without bias the amplifier draws no current. A regulated supply keeps the amplifier specifications more constant as the supply voltage varies.

When S4 is in the "FM" position, the application of bias and the closing of the TR relay is essentially instantaneous, following the sensing of an RF signal. When the HT ceases transmitting, the bias is removed and the TR relay opens, also essentially instantaneously. When S4 is in the "SSB" position, C32 is added to the circuit and while it doesn’t slow the turn-on significantly, it does slow the turn-off time. This delay, determined by C32 and R25 and R26, is

and a control/accessory board. The RF board contains the amplifier and matching networks, a TR relay, a lowpass filter, and a receiver preamplifier. The preamplifier, designed especially for this project by Janel Laboratories, supplies 10 dB of gain for use with those HTs whose receivers need a little bit "extra". It is a plug-in unit and is replaced by a jumper across points A and B when the preamplifier is not needed.

The matching networks perform the same impedance transformations as on the test amplifier. The networks are cascaded L and T sections. Multiple sections are used for the same reasons as explained in the discussion of the test amplifier, above. The inductor for the L sections next to the transistor consists of the transistor leads and a short length of microstripline on the PC board.

The five-pole output lowpass filter has a cut-off frequency of about 200 MHz. Two filter response "zeros" are introduced at about 292 MHz as second harmonic suppressors. The zeros are the result of capacitors C17 and C19. The second harmonic is more than 65 dB below the fundamental. Higher harmonics are further down and not measurable with the equipment used.

Fig. 6 is the PC board pattern for the front and back of the RF board and Fig. 7 is the parts layout.

Fig. 8 shows power output versus power input. It is a little bit less than the output of the test amplifier because of the losses in the relay and lowpass filter.

The amplifier performs smoothly. Its input/output characteristics exhibit none of the discontinuities or hysteresis common to bipolar power transistors. The tuning is very smooth and the tuning characteristics do not vary much with power level, as with bipolar transistors. Varying tuning, power level, and load VSWR while monitoring spectral output revealed no trace of spurious outputs.

The amplifier is well behaved and fully stable in any operating environment. It is possible to create oscillations by reactively terminating the input with no load on the output. This condition does not occur in normal operation.

A thermostat that opens at 175 degrees Fahrenheit is mounted on the heatsink near the amplifier transistor. Although you should always use more than adequate heatsinks to prevent overheating, there is always the possibility that even a well-protected unit might be covered by something — a carelessly thrown sweater, for example — that could cut off airflow. In such an event, in which overheating would be possible, the thermostat could prevent expensive damage.

The control/accessory board supplies the necessary switching and control circuitry for the amplifier and accessory circuits to increase the utility of the HT in the mobile environment.

An RF detector on the amplifier board supplies a voltage when the HT is keyed. This is sensed by U1B and turns on Q2 which controls the TR relay. U1B also controls U1A, which supplies a regulated voltage for biasing the amplifier. Without bias the amplifier draws no current. A regulated supply keeps the amplifier specifications more constant as the supply voltage varies.

When S4 is in the "FM" position, the application of bias and the closing of the TR relay is essentially instantaneous, following the sensing of an RF signal. When the HT ceases transmitting, the bias is removed and the TR relay opens, also essentially instantaneously. When S4 is in the "SSB" position, C32 is added to the circuit and while it doesn’t slow the turn-on significantly, it does slow the turn-off time. This delay, determined by C32 and R25 and R26, is
fig. 6. PC board patterns for 50-watt 2-meter amplifier: front (above), back (below).
added so that the unit doesn’t turn off between words because of the lack of a carrier on SSB.

Most multi-mode amplifiers on the market have this switch. Since the amplifiers are biased for linear operation in both FM and SSB modes, these switches have nothing to do with the linearity of the amplifier and serve only to insert a delay in one RF sensing circuit in the SSB mode to prevent the amplifier from keying in and out between words. The delay is adjustable and a compromise setting must be found. If you set the delay time long enough so that the amplifier doesn’t cut in between words, it may take an uncomfortably long time to switch to receive after you let up on the PTT switch.

RF switching is convenient but a better solution is to wire the amplifier for direct keying. An external keying line is supplied on this and most other amplifiers for this purpose.

U1C, U1D, and Q3 form a current-limited voltage regulator to power the HT. This circuit can be used in two different ways. In one, it will power the HT instead of the HT batteries. R15 is adjusted to set the output voltage at the rated voltage of the HT and R13 is adjusted so that the output current limits at a little over the transmit current drain of the HT. The power supply can deliver a little over one ampere.

The alternative is to use the power supply as a charger for the HT batteries. For this, adjust R15 to
set the output voltage to the fully charged voltage of the HT batteries and set R13 to the recommended charging current for the batteries. The batteries will be charged at this current until they reach full charge, at which time the power supply automatically switches to constant voltage and reduces the charge rate to whatever is needed to maintain full charge. CR8 will glow when the supply is in the constant current mode, confirming that the batteries are under charge. (See the January, 1983, issue of *ham radio* for an excellent discussion of this subject.) In the first mode, discussed in the previous paragraph, CR8 indicates an overload.

The final major accessory circuit is the one containing U2. This is a speaker amplifier to boost a low HT audio output signal to a level capable of driving a speaker that can deal with the high background noise in a vehicle. The LM383 is capable of supplying sufficient current. However, it is limited to a peak voltage swing of a little less than 1/2 the supply voltage. So use a low impedance loudspeaker if you want to make a lot of noise. The LM383 will typically deliver 4.7 watts to a 4-ohm load with a 13.2 volt supply. It will deliver 7.2 watts to a 2-ohm load, but only 2.4 watts to an 8-ohm load.

Making the control/accessory board separate from the amplifier board provides some flexibility in mounting. When the amplifier is mounted within easy reach of the operator, the control/accessory board mounts in the same cabinet as the amplifier. When the amplifier is mounted out of reach, such as in the trunk, the control/accessory board is removed from the amplifier chassis, mounted in a small remote control cabinet, and connected by cable.

**higher power**

The next step was to design a pair of amplifiers using 2 parallel DV1260Ts. The first amplifier was designed for 2 meters and the second for 1-1/4 meters.

As expected, the 2-meter amplifier was similar to the amplifiers just described. At a supply voltage of
16 volts, 100 watts of output was obtained with a little less than 10 watts of input. The gain and efficiency were lower at 13.6 volts. Performance curves are not included because all you have to do is use the single transistor amplifier curves and adapt for the doubling of power.

A single stage amplifier of this gain and power output will most likely be used with a mobile transceiver. A catalog search revealed that most new transceivers have a 25-watt output, so a design which supplied 100 watts output with 25 watts of input was pursued. Fig. 9 shows the amplifier schematic. Only the amplifier portion is shown because the control board is a simplified version of the one described for the single transistor amplifier, less the audio amplifier and the voltage regulator.

The amplifier consists of two single-device amplifiers connected in parallel. Each single-device amplifier is designed to work in a 100-ohm system. The input and output are both matched by a cascade of three L networks. Multiple L networks increase the bandwidth and reduce the circuit losses over that of single L matching networks. For both the input and the output, the inductors for the two L networks closest to the FETs are made from the transistor leads and the PC board traces.

For the input circuit, the highest impedance L network includes capacitors in series with the inductors (C1, L1 and C3, L2). This arrangement is used to break up a low frequency resonance (about 35 MHz) that can cause oscillations to occur in a push-pull mode. The use of series capacitors is undesirable from the standpoint of loss and bandwidth, but the degradations are not severe. The amplifier outputs are paralleled at less than the 100-ohm point, mainly as a matter of mechanical convenience.

Tuning ease and spectral purity were similar to the

![Fig. 10. 100-watt 220-MHz amplifier schematic.](image-url)
single transistor amplifier. The second harmonic is about 75 dB below the fundamental. An imbalance between the two sides was noticed while tuning, probably because of variations in input capacity. It was found that a 30 pF mica capacitor could be moved along the input lines until the output was maximized. This seemed to be adequate compensation for the imbalance, since after the capacitor was installed the two sides seemed to behave very symmetrically.

**temperature effects**

The amplifier was also tested in a temperature chamber over the range of -40 to +60 degrees C. Quiescent current, power output, gain, power bandwidth, and spectral purity were all examined. The quiescent current was very slightly temperature dependent. As expected, the current is higher at lower temperatures. The total variation was only 0.4 amperes across the entire range. The room temperature current was set at 6.0 amperes. In terms of RF parameters, the variations were so slight as to be difficult to measure. The gain appeared to be a few tenths of a dB higher at the low temperatures. Current drawn at the 100-watt point did not vary significantly with temperature. In all cases the spectrum was clean. In short, temperature effects are not a problem for this amplifier.

**1 1/4-meter amplifier**

The final amplifier to be discussed is a 1-1 4-meter amplifier using two paralleled devices. A schematic of it is shown in fig. 10. Many of its characteristics are quite similar to those of the lower frequency version, but, as might be expected, both the gain and efficiency were lower at this frequency. For example, with a supply voltage of 16 volts, 10 watts input produced 80 watts output, as compared to 100 watts at the lower frequency. An amplifier designed for 25 watts in and 100 watts out ran at 46 percent efficiency at 13.6 volts, as compared to better than 60 percent at the lower frequency. Quiescent current was set at 6 amperes for both the 2-meter and 1-1/4-meter amplifiers.

**conclusion**

RF power FETs offer a number of significant advantages over bipolar devices; they are easier to handle and allow somewhat simpler circuits. As manufacturers increase the selection and continue to improve specifications, we will see an increasing number of bipolar and vacuum tube designs being replaced with RF power FETs.

AMT-1
The Definitive
AMTOR Terminal Unit

$499.95 Introductory Price

AMTOR is the system of error correcting RTTY which has been rapidly overtaking conventional RTTY in Europe, just as its marine equivalent, SITOR, has been taking over in ship to shore communications.

It was originated by Peter Martinez, G3PLX (see June 1981 QST, p. 25). He first interpreted the international marine CCIR 476-1 specification for amateur use. Virtually all of the 400+ stations presently on AMTOR world wide are using software/hardware designs originated by Peter. The AMT-1 is a proven product which represents his latest and most highly refined design. It represents the culmination of over three years of development and on the air testing, and sets the standard against which all future AMTOR implementations will be judged.

Not only does it incorporate the latest AMTOR specification, but it gives superlative performance on normal RTTY, ASCII and CW (transmit only). As well as some fairly incredible real time microprocessor software, the AMT-1 boasts a four pole active receive filter, a discriminator type demodulator, a crystal controlled transmit tone generator, and a 16 LED frequency analyzer type tuning indicator, which is very easy to use.

Driven from a 12 volt supply, the AMT-1 connects to the speaker, microphone and PTT lines of an HF transceiver and to the RS-232 serial interface of a personal computer or ASCII terminal. All mode control is via ESCAPE and CONTROL codes from the keyboard (or computer program).

It used to be that C.W. was the ultimate mode for “getting through” when QRM and fading were at their worst. That’s no longer true — AMTOR will get through with perfect error-free copy when all other conventional transmission modes become useless.
CHAMPAGNE RTTY/CW on a Beer Budget

CP-1 Computer Patch™ Interface

The AEA Model CP-1 Computer Patch™ interface will let you discover the fastest growing segment of Amateur Radio: computerized RTTY and CW operation.

When used with the appropriate software package (see your dealer), the CP-1 will patch most of the popular personal computers to your transceiver for a complete full-feature RTTY/CW station. No computer programming skills are necessary. The CP-1 was designed with the RTTY neophyte in mind, but its sophisticated circuitry and features will appeal to the most experienced RTTY operator.

The CP-1 offers variable shift capability in addition to fixed 170 Hz dual channel filtering. Auto threshold plus pre and post limiter filters allow for good copy under fading and weak signal conditions.

Transmitter AFSK tones are generated by a clean, stable function generator. Plus (+) and minus (-) output jacks are also provided for CW keying of your transceiver. An optional low cost RS-232 port is also available. The CP-1 is powered with 16 VAC which is supplied by a 117 VAC wall adaptor included with the CP-1.

measuring noise figure

How noise figure, noise factor, ENR, and hot/cold terminations are interrelated

Most Radio Amateurs and electrical engineers learn early in their careers that the ability of a receiving system to respond to weak signals can be improved, not by the addition of gain, but by the reduction of noise.

It is the signal-to-noise ratio that ultimately renders a radio signal useless, and every amplifier or mixer (stage) in a receiver adds to the noise, thus decreasing the signal-to-noise ratio. The amount of noise added by an amplifier or mixer is given quantitatively as a noise factor which is the ratio of the input signal to noise ratio to the output signal-to-noise ratio:

\[ \text{noise factor} = \frac{S_i/N_i}{S_o/N_o} \]  

where

\[ S_i = \text{input signal power} \]
\[ N_i = \text{input noise power} \]
\[ S_o = \text{output signal power} \]
\[ N_o = \text{output noise power} \]

If the amplifier frequency response is wide, as compared to the bandwidth of the signal, no amplifier or mixer can improve the signal-to-noise ratio of the input signal. That is, if the input signal-to-noise ratio is 20 dB, the output signal-to-noise ratio will be less than 20 dB. A similar expression, the noise figure, is the "decibel" equivalent of the noise factor and is given by:

\[ \text{noise figure} = 10 \log_{10} (\text{noise factor}) \]  

Thus the signal-to-noise ratio of an input signal is reduced by an amount equal to the noise figure. That is, if a signal with a 20 dB signal-to-noise ratio is passed through an amplifier with a 5 dB noise figure, the output signal-to-noise ratio is 15 dB.

Because the ability of a receiving system is primarily limited by the noise performance of the first RF amplifier, measuring the noise figure is an important part of the receiver evaluation.

noise measurement difficulties

It would appear from the previous equations that measuring the noise figure of an amplifier should be a simple matter of measuring the signal-to-noise ratio of both the input and output of the unit under test. The difficulty in this method arises from the fact that the measuring equipment has noise contributions of its own, and it would be difficult to determine the signal-to-noise ratio of the input signal.

Another problem arises from the fact that the noise power is proportional to the bandwidth used for the measurement. Modulated signals have various relationships between measuring bandwidth and the measured power depending on the form of modulation. Therefore the signal-to-noise ratio can become a rather unpredictable function of the measuring system bandwidths.

This is the electronic equivalent of comparing apples and oranges. The solution lies in making the signal-to-noise measurement using a noise signal, and comparing it to the system noise. Using this method, the measured power is proportional to the measuring bandwidth for both signals and noise.

The device used to generate the noise signals is called a noise generator. It is important that the noise power output from a noise generator be greater than the noise power of a resistor at normal room temperature, otherwise the signal-to-noise ratio of the noise generator will be zero dB and of no value for measuring noise figure. The noise power output of any resistor at normal "room" temperature, 290° Kelvin, is:

By Albert Helfrick, K2BLA, RD1, Box 87, Boonton, New Jersey 07005
\[ P_n = KT_oB \]  \hspace{1cm} (3)

where \( P_n \) = the noise power  
\( B \) = the measuring bandwidth  
\( K \) = Boltzman’s constant  
\( T_o = 290^\circ \text{Kelvin} \) (17° centigrade)

If the noise power of the noise source is higher than a resistor at 290° K, it is equivalent to the noise power from a resistor at some temperature — say, \( T' \), which provides a noise power output of:

\[ P_s = KT'B \]  \hspace{1cm} (4)

where \( P_s \) = the noise power of the noise source  
\( T' \) = the equivalent noise source temperature

The noise power can be generated in several ways. First, a resistor at the higher temperature or some other artificial method such as using the noise current of a solid-state or thermionic diode could be used to generate the equivalent noise power.

A useful expression for the amount of noise power available from a noise source is called the excess noise ratio, ENR, and is given by:

\[ ENR = \frac{T' - T_o}{T_o} \]  \hspace{1cm} (5)

To measure the noise figure of an amplifier or mixer using a noise source, the amplifier is connected to a power measuring instrument and the noise source is connected. The power output from the device under test is measured. A termination, typically 50 ohms, at a temperature of 290° K is connected to the device under test and again the power output is measured. The ratio of the two power outputs, called the Y-factor, is used to calculate the noise figure. The Y factor is:

\[ Y = \frac{P_o'}{P_o} \]  \hspace{1cm} (6)

where \( P_o' \) is the power output of the device under test with the noise source connected, and \( P_o \) is the power output with the 290° K termination. The noise figure of the device under test is:

\[ NF = 10 \log_{10} \frac{ENR}{(Y - 1)} \]  \hspace{1cm} (7)

In theory, this technique is simple; however, the difficulty lies in making an accurate power measurement of the output power. A resistive termination at 290° K has a power output of \(-144 \text{ dBm} \) in a 1 kHz bandwidth and even after amplification by the device under test, the output is relatively small.

In order to increase the power to a point at which a convenient power meter such as bolometer type may be used, additional amplification is required. The noise figure of the amplifier used after the unit under test (post amplifier) will affect the noise figure measurement, according to the following relationship:

\[ NF = NF_1 + \frac{NF_2 - 1}{G_1} + \frac{NF_3 - 1}{G_1G_2} \]  \hspace{1cm} (8)

where \( NF \) = noise factor of the cascaded system  
\( NF_1 \) = noise factor of the first amplifier  
\( NF_2 \) = noise factor of the second amplifier  
\( NF_3 \) = noise factor of the third amplifier  
\( G_1,G_2 \) = gains of the first and second amplifiers, respectively

If the noise figure of the post-amplifiers is low or the gain of the unit under test is relatively high, the effect of the post-amplifier noise figure will be small.

If a signal were a simple sine wave, power could be determined by measuring the voltage with a sensitive voltmeter and determining the power by using the simple relationship \( P = E^2/R \), where \( E \) is the measured voltage and \( R \) is the system resistance usually 50 ohms. Noise signals are not simple and require a true power measurement. A bolometer type of power meter provides an accurate true-RMS power measurement for noise figure measurements. A diode-type voltmeter will provide the proper response if the diode is operated in the so-called square-law region. This is the region of the point contact diode characteristics where the rectified output voltage is proportional to the input voltage squared. A crystal detector or diode type voltmeter can be checked for square law response by increasing the RF input by 3 dB and checking for a two-to-one increase in the rectified output or, in the case of a voltmeter, a doubling of the meter deflection.

**test set-up**

Because the square-law region of a diode does not usually cover a large range of power, it is desirable to include an attenuator between the diode detector and the amplifier under test as shown in fig. 1.

To make a noise figure measurement using this set-up, the attenuator is adjusted to give a meter reading in the square-law region of the diode with the amplifier terminated (at its input) with a room temperature termination. This can be checked by increasing the attenuator by 3 dB and observing the meter reading.

The room temperature termination is replaced with the noise source (also called a “hot termination”), and the attenuator is adjusted to provide the same output reading as before. The amount of attenuation added is called the Y factor, in dB, which has to be converted to a pure ratio. This is used with eq. 7 to calculate the noise figure.

The measurement of noise figure requires a known ENR. Most Amateurs optimize the noise figure of a receiving system using a noise diode by adjusting the...
amplifier to give the greatest difference between noise power output with the noise diode on and off. The actual noise figure is not known unless the noise power of the diode is known. Noisy semiconductor diodes do not provide a calculable amount of noise power; commercially available solid-state noise sources are calibrated with a hot-cold noise source.

One very effective method of creating a known ENR is to maintain two identical resistors at a known temperature. Two commonly used temperatures are the temperature of liquid nitrogen at 77° K and the boiling point of water at 100° C or 373° K. The ENR of this system would be:

\[
ENR = 10 \log \frac{T - T_0}{T_0} = \frac{373 - 77}{77} = 3.84
\]

or as expressed in decibels: 5.8 dB.

This ENR would be fine for measuring systems with noise figures of a few dB, but it is difficult to maintain the cold termination at 77° K. The cold termination could be at “room temperature” (290°K), and the “hot” termination well above 290°K. One excellent source would be the hot filament of an incandescent lamp. In order to use an incandescent lamp for noise source, the lamp must have a resistance near 50 ohms (hot) and the temperature must be known. Both of these parameters may be determined from the change of resistance versus temperature of tungsten as shown in fig. 2.

As an example, assume that a lamp with a cold resistance of 5 ohms is used for a noise source. In order to increase the resistance to 50 ohms, a tenfold increase is required which corresponds to a temperature of 2000° K which produces an ENR of 7.5 dB. This temperature is typical of an incandescent lamp and can be achieved without resorting to special lamps.

A noise source was constructed using two miniature lamps used for illuminating electronic wristwatches (see fig. 3). The lamp is rated for operation at 1.5 volts at 15 mA, which is convenient because this calculates to 100 ohms hot. To determine the temperature of the filament, the cold, 290° K, resistance of the filament was measured and the temperature determined from fig. 2. The cold resistance was measured and found to be 16.8 ohms. The hot/cold ratio is 5.9, which corresponds to a temperature of 1300° K.

Two lamps in parallel correspond to a 50 ohm hot source at 1300° K, which is an ENR of:

\[
ENR = 10 \log \frac{T - T_0}{T_0} = 10 \log \frac{1300 - 290}{290} = 5.42 \text{ dB}
\]

Two 1/8 watt 100-ohm resistors were included in the noise source case as the “cold” terminator.

**noise source frequency dependence**

In order for a noise source to be effective, the impedance must be close to 50 ohms resistive throughout the frequency range of interest. The 100 ohms of the example noise source was determined from the DC operating conditions and does not include the inductive and capacitive components. The complete noise source will have the effects of the coupling...
Hy-Gain broadband vertical antennas load the new auto-tune solid state rigs, require minimal space and provide low angle radiation without the expense or the problems of support structures.

18AVT/WBS (80-10 meters) The most successful vertical antenna of all and for good reasons. Broadband performance covers the 40, 20, 15 and 10 meter bands in their entirety. Automatic band switching is accomplished by mechanically superior, highly efficient factory tuned Hy-Q traps with large coils for consistent performance at 2:1 or lower VSWR on 40-10 meter band edges; bandwidth on 80 meters is approximately 40 kHz with VSWR below 2:1. A factory tuned matching network for 50 ohms impedance is dc grounded for lightning protection and reduced precipitation static. The mechanical integrity of this antenna is so stable that performance does not change with the weather. The 18AVT withstands winds to 80 mph (128 km/h) without guying. All stainless steel hardware is included.

14AVQ/WBS (40-10 meters) Offers very similar construction and the same excellent broadband performance as 18AVT over the entire 40, 20, 15 and 10 meter bands; automatic band switching with mechanically superior large-coil Hy-Q traps and very low angle radiation pattern. The smaller, low visibility size also makes the 14AVQ very suitable for roof mounting. The optional 14AVQ roof mounting kit includes base plate, mast and radial/guy wires. All antenna hardware is stainless steel.

18 HTS (80-10 meters. 160 meters with optional loading coil) The superb reliability of the 18 HTS is manifest in installations now over 20 years old. And, with the improvements we made over the years, the 18HTS is now better than ever. Automatic band selection is achieved through a unique stub decoupling system which effectively isolates various sections of the antenna so that an electrical 3/4 wavelength (or odd multiple 3/4 wavelength) exists on all bands. For example, outstanding broadband performance on 20, 15 and 10 meters is achieved with an extended 3/4 wave coil. On 80 meters bandwidth is approximately 250 kHz at 2:1 VSWR. With the optional base loading coil exceptional performance is also provided at 160 meters. The galvanized tower requires no guying and withstands winds to 100 mph (160 km/h). A special hinged base allows complete assembly at ground level and permits easy raising and lowering. Includes stainless steel hardware. WARC kits to be available.

Other Hy-Gain vertical multiband antennas are available though not shown here. The 12AVQS (20, 15, 10 meter) is similar to 18AVT above but with VSWR of 1.5:1 or less on all bands. The 18VS (80-10 meter) comes with a base loading coil and may be installed on a short mast driven into the ground. All include stainless steel hardware.

**PHASE FOR GAIN**

Any two identical Hy-Gain verticals can be phased for excellent gain and directivity. A great system for beam performance on 40, 80 and 160 meters or for 10, 15 and 20 meters where space is limited. Send for our free technical report "Phased Verticals".

Hy-Gain Verticals that work the world at better Amateur Dealers.
In selecting an antenna, choose the longest one that will fit your property. It will cost less and have wider bandwidths. All Barker & Williamson dipoles are made from rugged #14 stranded copper clad wire for strength and conductivity. Unless otherwise noted, all antennas will handle the legal power limit. These dipoles may be installed as inverted "V"s, horizontally, or vertically. The tunable trap antennas are adjusted to any part of a band by sliding a tuning wire on the trap.

**measuring converter noise**

To measure the noise figure of a VHF/UHF converter, the converter is connected to a receiver as shown in fig. 4.

An RF probe connected to one of the later IF amplifiers of the receiver is used as a power indicator. Because the noise figure of the system is a function of the setting of the attenuator, the resulting measurement could be distorted. For measuring a noise figure of 2 dB or less with a gain of 20 dB or more, the error will be less than 0.1 dB.

Set the attenuator to 0 dB and terminate the converter with the cold termination. Connecting the converter to the receiver should produce a noticeable increase in background noise. Find a convenient point in the IF amplifier to connect the RF probe. A signal of 100 mW or less is usually in the square law region of the voltmeter. Disconnect the cold termination and connect the hot termination. Adjust the attenuator to provide the same RF voltmeter indications as before; the setting of the attenuator is the 'Y' factor, in dB, and is used in eq. 7 to calculate the noise factor.

Noise figure measurement determines one of the important operating parameters of receiving systems. The introduction of low-cost GaAs FETs has brought about a reduction of noise figure in many VHF and UHF receiving systems. Using a noise source and the techniques described in this article, it is possible to quantitatively evaluate the improvements effected by the latest technology.

---

**fig. 4. Test set-up for measuring VHF/UHF converter noise figure.**

---

**capacitor, the BNC connector and the inductance of the lamp filament. In spite of all of the reactances the return loss as measured on a network analyzer was better than 14 dB up to 1 GHz. Adding a 0.68 pF capacitor improved the return loss to 20 dB at 1 GHz, a very respectable figure for a noise source.**

This noise source is suitable for making accurate noise figure measurements to 1 GHz.

The 20 dB return loss of the noise source will allow noise figure measurements to an accuracy better than 0.1 dB.
THE INTERFACE is the original Kantronics terminal unit that broke through the barrier of multi-computer compatibility. THE INTERFACE is an amateur modem for transceiver-to-computer communication. With THE INTERFACE and Hamsoft or Hamtext for your computer you can send and receive Morse Code, Radioteletype, and ASCII. THE INTERFACE is also compatible with our new software for AMTOR communication, AMTORSOFT. THE INTERFACE is our most popular unit combining active filtering, easy tuning, six-computer compatibility, and low price for an unbeatable package.

Suggested Retail ........ $139.95

INTERFACE II is the new Kantronics transceiver-to-computer interface. INTERFACE II features a new highly sensitive front end with mark and space filtering and a unique new tuning system. Even the most discerning operator will be surprised with the INTERFACE II's ability to dig out signals in poor band conditions, and our new tuning system even displays signal fading.

X-Y scope outputs and dual interface outputs for VHF and HF connections make INTERFACE II compatible with almost any shack. All three standard shifts are selectable and INTERFACE II is compatible with the industry standard Kantronics programs: Hamsoft, Hamtext, and Amtorsoft. Step up to state of the art in computer-amateur communications with INTERFACE II.

Suggested Retail ........ $269.95

For more information see your Kantronics dealer, or contact:

Kantronics 1202 E. 23rd Street Lawrence, KS 66044
MORE FROM PRO-SEARCH™ ELECTRONICS

NOW THREE MODELS OF OUR
DIGITAL ANTENNA CONTROL
Your Choice Of Center, North Or South

GOOD
PSE-1A, 3A
The “CONTESTER” provides the least expensive
DIGITAL CONTROL UNIT WITH COMPLETE COM-
PUTERIZED CONTROL, BUT WITH LESS
FEATURES, than the “DX’ER” and “DELUXE.”
This unit gives your current position of your
antenna digitally in 5” steps. It has 2 memories
and the command mode, plus single button opera-
tion. The PSE-1A, “CONTESTER” comes with a
7.0 amp continuous duty motor supply. PSE-3A
has a 12 amp power pack.
It is not capable of being modified to talk or access
the computer interface or remote interface.
It is completely shielded and made of the same
quality components as the other models.
The warranty on our unit is one year on materials
and labor, and ninety days on parts.
This unit is a very inexpensive way to have the best
of both worlds. A real time saver during contests.
Hands off operation will save many hours of hang-
ing on the rotator. Just a few dollars more than the
manual control box, but worlds apart in state-of-the-
art and operation. Price $229.95*

BETTER
PSE-1, PSE-3
The “DX’ER” is the top of the line of the non-voice
synthesized units, and is for the ham who is in
need of more features on their controller. It has
“2” digital readouts, one to show the antenna’s
current position, plus a storage readout that holds
a heading or digitally displays your last position.
This is valuable for switching between long path
or short path, or checking front to back, or
working between two different stations, a real
time saver and a nice convenience.
The “DX’ER” also has “2” scan functions: 0-90,
90-180, 180-270, 270-360, and 0-360. This is a real
aid in looking for that dogleg opening or peaking a
weak signal. The “DX’ER” has 2 memories for
storing headings, it can be expanded to talk, and
does have the hardware necessary to use with the
computer interface.
It can be remotely keyed, where verbal confirma-
tion isn’t required. Price $362.95*

BEST
PSE-2, PSE-4
This is the ultimate in rotor controls. Nothing tops
this one. It has all the features of the other models, plus
talks. Yes, it talks.
The “DELUXE” has a voice synthesizer which con-
firms your entries. Plus tells you your heading as
you enter it and when your antenna arrives.
All commands are spoken, plus as your antenna
turns you hear a 440Hz tone going in one direction
and a 880Hz tone in the other. This gives you
positive verification of movement.
This unit, as the others, will combine with the
HAM IV, T2X, and HDR-300, giving you the best
antenna rotor combination you could ever want
any price. Price $469.95*

INTRODUCING THE ULTIMATE PACKAGE...FROM PRO-SEARCH™ NINE COMBINATIONS OF
OUR CONTROL UNIT AND THE TELEX/HYGAIN* ROTOR MOTORS...
FOR JUST A FEW DOLLARS MORE YOU CAN HAVE THE CONTROLLER OF THE FUTURE TODAY!

Package #1 PSE-1A
#1 The “Contester” Package...try one of these
TELEX/HYGAIN motors with our PSE-1A/3A. A
system which is low in cost, high in performance.

HAM IV* T2X* HDR-300*
PSE-1A will save you lots of time in your favorite
contests. No more hanging on the rotor control...gives you positive control with DIGITAL
readout plus 2 memories, command positioning,
and single button manual movement.

Package Special
PSE-1A + HAM IV $369.95
PSE-1A + T2X 415.95
PSE-3A + HDR-300 544.95
*Printed with permission of TELEX/HYGAIN
Telex Communications, Inc.

Package #2 PSE-1/PSE-3
The “DX’ER” Package...couple this unit with a
rotor and you have the best non talking control we
make. Expandable plus has a scan function, 2
DIGITAL displays and REC/LAST to check long
path or short path. Has all internal hardware to
plug into our computer interface. Can be remotely
controlled from accessory jack. Try this with any of
the TELEX/HYGAIN* Rotors! This will give you the broadest of functions with a
mid-range price.

Package Special
PSE-1 + HAM IV $502.95
PSE-1 + T2X 548.95
PSE-3 + HDR-300 677.95

Package #3 PSE-2/PSE-4
The “Deluxe” is the most sophisticated antenna
control unit ever made. With the “Deluxe” you have
all the functions of our other units, plus talks...Yes, it talks. Not only do you have your
headings digitally displayed, but is also said on
your antenna stops...All commands are spoken
plus as your antenna turns you hear a 440Hz tone
in one direction and an 880Hz in the other, giving
you positive verification of movement. This unit
when combined with the HAM IV, T2X or HDR-300, gives you the best buy anywhere at any price...

Package Special
PSE-2 + HAM IV $608.95
PSE-2 + T2X 655.00
PSE-4 + HDR-300 794.00

A BETTER ANTENNA

WHY SETTLE FOR LESS?
LOOK WHAT THE MOSLEY TA-33 OFFERS

- 3 Element full power
- All stainless steel hardware
- Ease of assembly
- No balun required
- Now a 2 year limited warranty
- Now a standard 2" mast adapter
- Built to last

- Expandable to 30 or 40 meters
- Superb front to back ratio
- Excellent gain
- Outstanding SWR

SPECIFICATIONS:
- Forward gain
- Front to Back Ratio
- Power rating
- SSB
- Feedpoint Impedance
- VSWR HT Resonance
- Matching System
- Number of Elements
- Longest Element
- Boom Length
- Mast Size
- Turning Radius
- Wind surface area (in. sq. ft.)
- Wind load (EIA standard 30 mph)
- Assembled WT.
- Shipping WT.

- Used around the world
- Work CW or phone without tuning or adjusting antenna
- A great antenna for the new solid state rigs

verticals over REAL ground

Ground system geometry and soil conditions determine performance

How does the geometry of a radial system or ground screen affect the radiation pattern of a vertical? How do ground and roof mounting differ? How does gain change with the frequency of operation? And do reflections depend on the dielectric constant and conductivity of the ground? This article — complementing our series on vertical phased arrays by K2BT — addresses these and other questions, in one of the clearest presentations on this important subject ever to appear in the Amateur literature. — Editor

Many hams using verticals have wondered how the ground or earth beyond the radial system affects the radiation patterns of their antennas. Much has been written about the need for a good ground screen or radial system to provide a low-loss return path for ground currents. However, not much has been written for Amateurs about how ground reflections affect the performance of a vertical over real ground.

horizontal versus vertical polarization

For dipoles and other antennas putting out predominantly horizontally polarized waves, reflection from a perfectly conducting ground gives a 180 degree phase shift and reflected electric field intensity equal to the incident field. For real grounds the phase shift remains close to 180 degrees and there is little attenuation of the incident wave. That is why reflection from perfect ground is said to indicate what may be expected of a horizontal antenna over real ground.

The situation is quite different with vertically polarized radiation, which is reflected from perfect ground without phase shift or attenuation. However, only salt water is accurately represented by perfect ground. Any other ground, even saturated, fertilized farmland, provides large phase shifts and attenuations of incident radiation which also strongly depend on the angle of incidence and reflection. At grazing angles of incidence and reflection, the phase shift is 180 degrees and there is no attenuation, just as with horizontally polarized radiation. As the reflection angle increases, the phase shift and reflected field intensity both decrease very rapidly, until an angle is reached where the phase shift is 90 degrees and the reflected field intensity is minimum (maximum attenuation). This angle is called the pseudo-Brewster angle and ranges from 2 degrees for salt water to 30 degrees for rocks or dry sand. At this angle, the radiation pattern of a vertical is affected least by ground reflections. Below the pseudo-Brewster angle, the reflected wave of a ground-mounted vertical partially or wholly cancels the direct wave, while above this angle, ground reflections enhance direct radiation. Generally, the better the ground, the smaller the pseudo-Brewster angle, and the greater the gain from ground reflections.

The radiation pattern of a vertical over infinite, perfectly conducting ground is maximum toward the horizon (takeoff angle of 0 degrees). However, a vertical over real ground has no sky wave radiation.

HIGH PERFORMANCE
COMMERCIAL QUALITY
UHF/VHF CONVERTER KITS

Professionally engineered using the high performance DBM. These kits are designed with the active VHF'er in mind. All parts, components and circuit board are of the highest quality. Gold anodized case ensures circuit integrity. Each kit includes easy-to-read, fully illustrated instructions. VHF units use crystal control. UHF converters are tunable. Crystal control UHF models available soon. In the unlikely event of construction problems, complete factory back-up assistance is available from trained technicians.

toward the horizon and a lobe of maximum radiation varying from 15 degrees, for exceptionally good soil, to 30 degrees, for completely dry rocks and sand. In practice, then, real ground decreases the gain and significantly raises the radiation or takeoff angle of a vertical.

free space patterns and ground reflections

To keep things simple, we will concentrate on a quarter wave, current-fed vertical with a quarter wave, perfectly conducting ground plane, mounted over real ground. The radiation patterns of practical verticals with sixty or more radials will closely approach the patterns presented here.

The overall approach is to combine the results of the optical theory of reflection with the free space pattern of a particular vertical configuration. This composite picture shows a radiation pattern modified by reflections from ground having a particular conductivity and dielectric constant.

The free space pattern is calculated from the standard electric field intensity formula for a quarter wave vertical with an infinite, perfectly conducting ground plane. The ground plane defines a collinear quarter wave image "antenna" below the ground screen (fig. 1). In other words, a quarter wave vertical with an infinite ground screen is electrically similar to a half wave vertical dipole except in the feedpoint resistance of the vertical, which at 36 ohms, is just half that of the dipole; its power gain is also 3 dB higher. In our case, the ground screen is a quarter wave in radius instead of infinite. Here the image antenna will be electrically shorter than a quarter wave at takeoff angles θ less than some critical angle defined by the geometry of the system. The progressive shortening of the image as the radiation angle is lowered modifies the free space pattern from what you get with an infinite ground screen, in which the image has the same length as the antenna at all radiation angles.

Ground reflections are determined from the Fresnel equation for the reflection of vertically polarized electromagnetic waves from a plane surface. A set of reflection coefficients, or ratios of reflected to incident field intensities, are calculated for useful takeoff angles in 5 degree increments over ground of a particular conductivity and dielectric constant. If we call the incident-electric field intensity $E_i$, the reflected field intensity $E_r$, and the reflection coefficient $R$, then $E_r = R \cdot E_i$, and $E_r$ is added vectorially to the free space direct field intensity $E_d$ at each takeoff angle to construct a vertical radiation pattern for a vertical over real ground (fig. 1).

ground screen geometry

The radiation pattern of a vertical is strongly influenced by the slope or angle below horizontal of the quarter wave ground screen or radial system. Fig. 2 shows 80-meter vertical radiation patterns of quarter wave verticals, ground mounted over very good ground (e.g., wet, fertilized farmland). The angles of radial slope are 0 degrees (horizontal radials), 20, and 40 degrees. The configuration with ground systems sloping below horizontal correspond to the antenna mounted atop a mound "carpeted" with a ground screen or dense network of radials. Note that the verticals with sloping radials have a significant gain advantage over the horizontal or 0 degree radial configuration — 2.5 dB at a 10 degree
takeoff angle in the case of a 40-degree radial slope. This angle is about the optimum slope. As the slope gets steeper, the gain decreases due to increasing radiation resistance. Other bands besides 80 meters show similar gain increases with sloping radials.

Fig. 3 shows what to expect if you live in a desert or on dry, sandy ground anywhere, or in a city, surrounded by concrete and asphalt. In these settings, the advantage of sloping radials completely disappears. Even over average ground with moderate dielectric constant and conductivity, little is to be gained from a sloping ground screen. Over average or poor ground, the combined phase shift from reflection and from the path length difference between $E_i$ and $E_r$ (fig. 1), is between 90 and 180 degrees for useful takeoff angles; this large phase shift leads to substantial cancellation of $E_d$ by $E_r$.

The advantage of a sloping ground screen is regained over a fresh water ground, even though the conductivity is insignificant (fig. 3). Compared to very poor ground, a fresh water ground offers a gain of up to 7 dB and compared to average ground, a gain of 4 dB. This is because the high dielectric constant of water provides a good reflecting plane.

These radiation patterns suggest that it’s possible to enjoy a seasonal advantage with sloping radials. Several days of rainy weather can raise both the dielectric constant and the conductivity a great deal, leading to another 2 to 6 dB of reflection gain at takeoff angles below 30 degrees.

**roof or tower mounting**

Unless a vertical is mounted two to three wavelengths high, putting it up in the air does not increase the gain, as it does with most horizontal antennas. In fact, about 1 dB at one quarter wavelength high is lost, compared with a ground-mounted vertical (fig. 4). Of course, if your ground-mounted antenna is completely boxed in by cars, buildings, or other obstructions, getting the current loop above the lossy surroundings may still pay off. The gain trends with radial slope seen for ground mounted verticals also appear for elevated verticals.

About half a wavelength above ground at the base is a particularly unfortunate height at which to mount a vertical over most grounds. Fig. 4 shows the 40-meter radiation pattern of a quarter wave vertical

---

**fig. 3. Vertical radiation patterns as a function of ground conditions.**

---

**fig. 4. Vertical radiation patterns of a vertical mounted at various heights above ground.**

---

**fig. 5. Vertical radiation patterns of 40 and 80-meter verticals and horizontal dipoles.**
with 20° radial slope, at one half wavelength high. It has up to 5 dB less gain at the most useful radiation angles than the same antenna, ground-mounted over very good ground. Other radial geometries at one-half wavelength show similar losses. Only a vertical over salt water shines at this height, giving about 7 dB gain at 5 degrees, which is especially good for the bands above 30 meters.

**vertical versus dipole**

Recently there has been interest in discussing whether the vertical or dipole works better on the various bands. Fig. 5 compares the 80-meter radiation pattern of a ground-mounted quarter wave vertical having 40-degree ground screen slope, with the broadside pattern of a half wave dipole one quarter wavelength above very good ground. The dipole at about 65 feet (20 meters) is as high as most Amateurs would mount an 80-meter dipole. The vertical shines at takeoff angles below 30 degrees, while the dipole takes over at higher angles. Undoubtedly some 80-meter DX comes in at angles above 30 degrees, as do most short-hop signals. In that case the broadside dipole looks like the better antenna.

**fig. 6.** Vertical radiation patterns of 10 and 80-meter verticals over differing grounds.

However, for most really long-hop circuits, the vertical would be the better choice.

**calculating vertical radiation patterns**

To calculate vertical radiation patterns, first define the following terms:

- \(E_d\): direct (free space) field intensity
- \(E_i\): field intensity incident on the ground
- \(E_r\): field intensity reflected from the ground
- \(R\): reflection coefficient, equal to \(E_r/E_i\)
- \(K_e\): dielectric constant of the ground
- \(\sigma\): conductivity of the ground in millihm/meter
- \(\lambda\): wavelength in meters
- \(\theta\): takeoff angle of the direct ray. Also equal to the angle of incidence and reflection (fig. 1)
- \(\phi\): angle of refraction of the transmitted ray
- \(\rho\): phase shift due to reflection
- \(\beta\): phase shift due to the path length difference between direct and reflected rays (fig. 1)
- \(h\): height of the antenna above ground, in meters
- \(G_i\): gain in dBi relative to an isotropic radiator

The electric field intensity \(E_d\) or \(E_r\) is expressed as a function of the current, which is a standing wave on the antenna (radiator plus image). This current function is integrated over the length of the antenna, including the image, to give the free-space field intensity at a particular \(\theta\). If \(\theta > 0\), the intensity is \(E_d\) and if \(\theta < 0\), we call the intensity \(E_i\). \(E_r\) corresponds to the ray reflected from the ground.

\[ R = \frac{\sqrt{K_e} \sin \theta - \cos \phi}{\sqrt{K_e} \sin \theta + \cos \phi} \]

where \(\phi = \sin^{-1} \frac{1}{R_{12}}\), and the complex dielectric constant

\[ K_e = K_e - j(6 \times 10^{-4}) \cdot \sigma \cdot \lambda \]

For each \(\theta\), \(E_d\) is calculated and for \(-\theta\), \(E_i\), the corresponding ray directed downward, is calculated. Then \(E_r = R \cdot E_i\) and \(E_i\) is determined by adding the \(E_d\) and \(E_r\) vectors:

\[ E_i = \left[ E_d^2 + 2E_dE_r \cos (\rho + \beta) + E_r^2 \right]^{1/2} \]

The gain at a particular takeoff angle is \(G_i = 20 \log E_i + A\), where \(A\) is a normalization factor which gives the correct gain of the vertical being considered at 0 degrees takeoff angle over infinite, perfectly conducting ground. For example, \(A = 5.16\) dBi for a quarter wave vertical with 0 degrees radial slope at ground level over infinite, perfect ground. Thus, various combinations of radial slopes and grounds will all give \(G_i\) expressed in dBi.
On 40 meters, a half wave dipole one half wavelength above very good ground, pitted against a ground-mounted vertical with 40° radial slope, has a broadside gain advantage above 15 degrees (fig. 5). This angle is about the median for New England to western European circuits on 40 meters. Again, the dipole looks better for most medium and short-skip circuits, while the vertical has a slight advantage for very long hops and band conditions favoring very low radiation angles.

On 10 through 30 meters, a vertical is at more of a disadvantage because its reflection gain drops off faster with increasing frequency than the reflection gain of a dipole. As fig. 6 shows, on 10 meters a ground-mounted vertical with 40 degree radial slope over very good ground has 3 dB less gain at a takeoff angle of 10 degrees and 4 dB less gain at 5 degrees than a similar vertical on 80 meters. A vertical on 10 through 30 meters simply can't compete with a dipole one or more wavelengths high over any ground except salt water. Between 30 and 40 meters is the point at which the dipole really takes over.

Conclusion

No doubt the long-standing debate will continue over whether a vertical or a dipole is the better antenna. I hope the results presented here will encourage more good A-B comparisons of verticals with other simple antennas. The worldwide system of beacons on 14.100 MHz should aid in these comparisons.

These results also show that ground mounting in the clear is generally the best way to set up a vertical. If the ground beyond the radial system is exceptionally good, the radials can be sloped downward 20 to 40 degrees for another 2 dB or more of reflection gain. Over salt water, a vertical with ground system sloping down to water level and 0.5 miles (0.8 km) of salt water in all directions would be a hard antenna to beat, especially on 10 through 30 meters, where 7 dBi of gain below 5 degrees is what is needed for long hop DX (fig. 6). However, for most grounds the ability of the vertical to launch low angle (below 15 degrees) radiation has often been overrated in the Amateur literature.

Acknowledgement

I thank Dick Coombe, K9VPK, for his interest and encouragement throughout this project.

Race car communications demand the best from an antenna under some of the worst conditions. Split second decisions require reliable signals at exceptionally high speeds.

That's why Larsen Antennas are used on race cars at the Indy 500. Because Larsen Antennas are designed to take high speed with minimal signal distortion. Proving they can travel in the fast lane without putting a drag on their performance.

Larsen's precision tapered stainless steel whip provides maximum flexibility while minimizing radiation pattern distortion, giving you a clear consistent signal. And Larsen's exclusive Kürod® plating, gives your antenna high conductivity to assure that maximum power goes into communicating — not heat.

That full measure of performance goes into our product integrity too. With a no nonsense warranty that won't slow you down.

So, whether you're following the racing circuit or a local rescue effort, you'll find Larsen Antennas will keep you ahead of the situation with dependable performance. Ask your favorite Amateur dealer to demonstrate how you can hear the difference with Larsen Antennas.

Write for our free Amateur catalog.
the VHF/UHF challenge

Although I’m usually branded as a VHF/UHF person, I’m really a DX’er and go where the DX goes, be it 160, 20 meters, or 13 cm. (I’m fully equipped for 13 different Amateur bands and operate them all!) So after I made the sought-after DXCC Honor Roll in 1968, I decided that someday I’d probably have every country confirmed on HF (which I did in 1980) and that the best challenges remaining would be on the VHF/UHF bands. I never abandoned the HF bands — as any DX’er will tell you — but I now tend to concentrate my efforts on improving the state-of-the-art on the frequencies above 50 MHz.

opportunities

Let’s digress briefly and discuss some of the opportunities awaiting us on the VHF/UHF frequencies. This is truly the area for propagation research, and there are records galore just waiting to be made or broken. Disregarding EME and OSCAR for the moment, look at what’s happened on 6 meters in the last few years: WAC has been worked by many. Even places like India, Gambia, the Galapagos Islands, Cyprus, and other equally distant places have become workable from North America via F2 propagation.

Then 2 meters opened on the transequatorial path. To our surprise, it wasn’t as spotty as expected. In fact, 220 MHz QSOs were finally made and a one-way 70 cm QSO has been verified. Speculation on the existence of a new propagation mode was heard, with hints that FAI (Field Aligned Irregularities) similar to the transequatorial path could possibly exist in the mid-latitudes such as the U.S.A. This was finally confirmed, and QSOs on 2 meters using this mode have been accomplished numerous times; but while it’s still possible above 148 MHz, this has yet to be done!

A true Amateur communications satellite, OSCAR 10, is now available to all Amateurs. Then there’s EME, the ultimate challenge on Amateur power levels. Worldwide QSOs now take place daily on frequencies from 144 to 2320 MHz. These QSOs are no longer the result of a concerted effort by many individuals pooling their efforts; instead, they’re being done by the everyday Amateur who may live on a 60 by 100-foot lot, but is willing to take on the challenge, do the research, and build up a good station. And while this isn’t a task for the timid, many non-technical persons are doing it every day.

Let’s look beyond operating and propagation. These discoveries weren’t made by accident; they happened and were exploited because the state-of-the-art gear had been improved.

benefits

So you say, what’s in it for me? PLENTY. You too can contribute to the state-of-the-art. There is much to be done: some may contribute labor, helping assemble large antenna arrays; others may assist with parts procurement, machining, research, scheduling, antenna design, receiver design, transmitter design and so on. But there’s something here for everyone, and the rewards are numerous: records to be broken, propagation modes to be discovered (this takes time and scheduling), new improved antenna systems (better mechanical designs as well as electrical parameters), better receivers with lower noise figure and high dynamic range at the same time, and more efficient and cleaner transmitters. (For you HF’ers, have you ever tried to use a frequency adjacent to a station running 100,000 to 1,000,000 watts effective radiated power?) The satisfaction will be enormous. The VHF/UHF frequencies offer a great test bed where you can develop new techniques, circuits, and antennas even if you are restricted to a small or not-so-great location.
Why all the hype? I'm constantly confronted by very competent individuals who are willing to build or buy their own gear to get on the VHF/UHF frequencies but always ask the same questions: "What's the best preamplifier circuit? What's the best antenna for my application? What band should I try?" The answers are not always simple — and often depend on the individual — but there is always one problem common to all the inquiries: where do I find the information I need to put together this gear? The answer is right here, because I've been asked by Rich Rosen, the Editor-in-Chief of ham radio, to launch this column as a continuing series. Over the coming months I'll try to discuss many of the questions most commonly asked by the newcomer as well as the seasoned VHF/UHF'er. This will be done with concise descriptions, charts, and circuits. After establishing a solid base of factual material over the first few months, I'll then attempt to build on this basis by offering updates, new or state-of-the-art equipment design information, advice on construction of antennas, propagation information and discussion of other subjects that will keep us all up to date. Time and space permitting, we may even include material or ideas expressed by others. Each month I'll also try to list events that are of special interest to VHF/UHF'ers.

Does this seem like the kind of information you're looking for? If so, I'll see you next month.

Tell 'em you saw it in HAM RADIO!
Brings you the Breakthrough!

MBA-RC Code Converter
This full function decoder and display unit represents the latest in state-of-the-art decoders. Morse, Baudot, and ASCII. Will perform serial to parallel and parallel to serial code conversions as well as cross mode conversions. Two powerful PS, 43 ICs, make up one complete package. Compatible with HF, VHF and UHF bands and RTTY modes. Separate receive filters are ahead of and behind a special signal limited circuit.

AEAS Computer Patch CP-1
A Personal Computer + Your Transceiver + AEA's CP-1 = FUN! Get a professional quality RTTY/CW terminal on a beer budget price. Easy to hook up and use. The CP-1 demodulator provides greatly improved performance compared to popular single channel RTTY detectors. With appropriate software and your personal computer, you can have hours of fun.

ISOPOLTM
Models available for: 144 MHz, 220 MHz and 440 MHz. Maximum gain, very low angle of radiation. Covers complete band with SWR less than 1.4-1.

AEA Contestertm CK-2
Here's great gift idea for your favorite ham. Designed with the needs of the active contestor in mind — at a price that is affordable. Has an 800 character message memory that can be soft partitioned into as many as 10 sections. Mistakes are easily corrected with unique edit mode. Also has automatic serial number generator.

AEA Amtor Terminal Unit AMT-1
AMTOR is fast growing in popularity. Don't you want to join the fun? Computer based, self correcting mode of transmission virtually ensures error-free copy — even with strong interference or weak signals, AMTOR can get your message through. AMT-1 contains everything you need to get on AMTOR with the addition of your radio and personal computer. Will also work on standard RTTY and CW for additional flexibility. Great Christmas gift idea. State-of-the-art FUN.

Inexpensive surplus components and scope bring you satellite weather pictures

Too often Amateurs will not attempt a project because it appears, at first glance, to be far too complex; reception of weather images from the geosynchronous satellites is certainly one such project. After reading several excellent articles on the subject, I was convinced I'd need at least a four to six-foot dish and a $400 downconverter in order to build the required equipment. But I decided to try to build the system anyway, using whatever surplus materials I could obtain.

antenna

While I did not — and still do not — have a four or six-foot microwave dish antenna, I did have a small 30-inch dish that had been collecting dust for about fifteen years. Now, the gain difference between a six-foot dish and a thirty-inch dish is determined by the ratio of the dish areas. The six-foot dish has an area 5.76 times the thirty-inch antenna. This translates to a gain difference of 7.6 dB. The focal length of the thirty-inch dish was measured to be 10.8 inches. (The focal length of an existing dish is easily found by dividing the diameter squared by sixteen times the depth.) Next, the F number, or focal ratio, was calculated. This is simply the focal length divided by the diameter, just as for photographic lenses. The focal ratio for the thirty-inch dish is 0.36.

By John M. Franke, WA4WDL, 1310 Bolling Avenue, Norfolk, Virginia 23508
Once the dish was characterized, I designed the feed, selecting a horn feed because it was the simplest. (After all, this is an Amateur project, not a research program.) I used a piece of five-inch outside diameter aluminum tubing, following an excellent article on waveguide or horn feeds for dish antennas. I chose RG-58 for the feedline from the antenna to the preamp.

**antenna mount**

The mount consists of a simple frame made from rack panels and aluminum angle supports. The elevation and azimuth angles for the G.O.E.S.-East satellite were calculated for my station latitude and longitude.

The dish is aligned in azimuth by simply turning the entire mount. A simpler, more compact, mount (see photograph) would be hard to devise. The mount was initially aligned with a compass taking magnetic declination into account. The beamwidth of the antenna is about sixteen degrees; hence, alignment is not critical. The feed can be rotated to adjust for optimum polarization. GOES-East and GOES-West satellites are vertically polarized and GOES-Central is horizontally polarized.

**downconverter**

The downconverter consists of a mixer and a local oscillator. The local oscillator is a solid-state unit from a weather balloon telemetry transmitter and was purchased at a local hamfest for five dollars. The antenna and modulator were removed and an output connector and bias network added (see fig. 1). Though the solid-state unit is difficult to obtain, Fair Radio Sales still carries a vacuum tube version for under five dollars. Output power from either source is high: 20 to 100 mW. The output frequency is nominally 1680 MHz ± 20 MHz with a manual tuning control.

The mixer uses a single-ended diode with the local oscillator signal inserted using a directional coupler. Fig. 2 shows the dimensions used with 1/16-inch glass epoxy double-sided printed circuit board material. One side is unetched. The etched side was laid out by first covering the entire copper surface with transparent tape, using a razor blade to trim away the unwanted areas. The areas to be etched away were left covered. (While this is the reverse of most tape techniques, my reasoning will soon become clear.) The board is now sprayed with any color lacquer that is handy; I prefer flat black. The remain-
ATV TRANSMITTER/CONVERTER: $399 delivered TC-1 plus

- OVER 10 WATTS PEP OUTPUT: Crystal controlled continuous duty transmitter. Specify 439.25, 434.0, 426.25 standard or other 70 cm frequency. 2 freq. option add $26.
- BASE, MOBILE, or PORTABLE. Use the builtin AC supply or external 13.8 vdc. Do parades, Marathons, etc.
- TWO VIDEO AND AUDIO INPUTS for camera, TVRO, VCR, or computer. Wide bandwidth for broadcast quality color video and computer graphics. Standard broadcast subcarrier sound which is heard thru the TV speaker.
- RECEIVE ON YOUR STANDARD TVSET tuned to channel 3 or 4. Sensitive varicap tuned TVC-2L downconverter covers simplex and repeater freq. over the whole 420-450 mHz 70 cm amateur band.
- ATTRACTIVE 10.5 x 3 x 9 CABINET.

FCC & NASA OKs SHUTTLE VIDEO
Want a chance at seeing W5LFL live as he works 2 meters? Its been great hearing the audio on the various repeaters, but now, if you hold a technician class or higher license, and have a TVRO capable of receiving Satcom IR transponder 13, you can repeat the space shuttle video to your fellow hams using our TC-1 plus. Just connect the composite video and line audio from the Satellite receiver to the video and audio inputs of the TC-1. Depending on your antenna, coverage will be typically the same as 2 meter simplex. Local area hams can receive with just one of our 70 CM downconverters and an antenna.

ATV 70 cm DOWNCONVERTERS
For those who want to see the repeated shuttle video, and other ATV action before they commit to a complete station, the TVC-4 is for you. The TCV-4 contains the TVC-2 module mounted in a cabinet with AC supply ready to go. Connects 420 to 450 mHz. Just connect 70 cm antenna and your TV set tuned to ch 3 or 4. TVC-4L hotter preamp for fringe areas. TVC-4G GaAsFet preamp stage.

ORDERING INSTRUCTIONS: Order by catalog number. Enclose check or money order with your order. ORDERS FOR SHIPMENT TO OTHER COUNTRIES WILL BE QUOTED ON REQUEST. POSTAL SAVINGS CARD ORDERS NOT ACCEPTED.

ing tape is peeled off carefully. The unwanted areas are now bare and the desired areas are protected by lacquer. The ground side of the board is painted. After drying, the board is etched with ferric chloride.

The finished board is scrubbed with steel wool to remove the paint and wiring is completed. Care must be taken when installing the connectors to make sure that copper is removed from around the center pin-hole on the groundplane side to prevent shorts. (I used SMA connectors, but BNC connectors would also work.) Connectors are placed at each end of the local oscillator coupling line. The end nearest the mixer is the input; a terminator or dummy load is connected to the most distant connector. About 750 microamperes mixer current is normal. This can be measured by lifting the ground end of the choke and inserting a ten-ohm resistor. Measure the voltage drop across the resistor and calculate the current. Too high a resistance reduces the mixer current, giving a false answer. The noise figure is probably around 12 dB.

**Intermediate Amplifier**

The IF frequency I used is 30 MHz. This frequency was chosen for two reasons. First, it fell within the range of the difference between the tunable local oscillator and the 1691 MHz signal. Second, it is the center frequency for my ART-26 panadapter, an invaluable tuning aid. (The panadapter cost only five dollars at the same hamfest where I purchased the local oscillator.) In fact, the panadapter was used as my first demodulator by reducing the scan to zero and using slope detection. The IF amplifier used has
a gain of 60 dB. Any surplus 30 MHz radar IF could be used. A minimum bandwidth of 30 kHz is needed — more is preferred (2 MHz) if a panadapter is used.

**detector**

I do not have a 30 MHz FM discriminator, so I up-converted the 30 MHz IF to the FM band and used an FM monitor receiver for detection.

**preamplifier**

Several excellent articles on low-noise amplifiers are available. I decided to build a two-stage amplifier, designing around the MRF-901 transistor. The layout is shown in fig. 3. The heavy, wide lines are quarter wave transformers and the narrow lines are quarter wave chokes. The board is laid out using tape and spray paint in a manner similar to that used for preparation of the mixer unit. The dual emitter leads pass through the board and are soldered to the groundplane. Because the emitters are grounded, active biasing is used. The circuit in fig. 4 was wired on a small printed circuit board and mounted in the preamp housing. Short leads prevent oscillation. The PNP biasing transistors are wired as constant current generators. The collector current of the MRF-901 is determined by the bias transistor emitter resistor and the collector voltage of the MRF-901 is determined by the base voltage of the bias transistor.

100 pF chip capacitors are used for coupling and bypassing. The overall gain is about 18 dB and the noise figure is better than that of the converter operated alone.

The total cost of the project at this point is about $18.00.

In the photograph of the panadapter (fig. 5), the signal-to-noise ratio can be seen to be about 7 dB. If the antenna were set up outside, the signal-to-noise ratio would be 10 dB.

**display**

To photograph the satellite signals, I borrowed a Tektronix oscilloscope and camera (fig. 6), using Polaroid type 667 film (ASA 3000). The photographs (see figs. 7, 8, and 9) were recorded in real time. The horizontal sweep was triggered by a 4 Hz signal from a color burst crystal oscillator. A variable divider chain was used for initial phasing. The vertical sweep was generated with a homebrew 10 bit D to A (digital-to-analog) converter (fig. 10), connected to a counter that counted horizontal sweep pulses. The video was fed, unfiltered and unrectified, to the oscilloscope Z axis.

**conclusion**

Future work will include moving the antenna out-
side, possibly building a four-foot dish, tape recording the signal and replacing the mixer/local oscillator with an interdigital crystal-controlled unit. In my experience, I've found that the best way to get involved with microwave technology is to use what you have and get on with it; don't be put off by high prices or sophisticated equipment. (Please enclose an SASE with any questions.)

ham radio

Now you can get in on the fun on packet radio!

- Low cost!
- Adaptable to any transceiver
- Easy to learn; easy to use
- Nearly 50 commands
- Built-in packet modem and CW identifier
- Use with teletype machines, computers, terminals
- RS232 serial interface - 45 to 9600 baud
- Uses both ASCII and Baudot
- Vancouver protocol - AX25 to be released soon
- Stores messages until requested at a later time
- Operates in connected and general modes
- Actuates teletype motor to print messages
- Board accepts up to 14K of RAM
- Model PK1 can be customized for Commercial Systems

Protocol can be changed by swapping ROM chips. Board designed to accept 6264's for up to 56K of RAM with minor modification.

Dimensions: 4.5 x 9.5 inches; 1" vertical clearance.
Power requirement: +12 VDC, approx. 200 ma.

Standard equipment includes 4K of RAM (expandable to 14K).
Model PK1, wired & tested — $149.95
additional memory, installed & tested (up to 10K) — $10/2K
RTTY adaptor board — $9.95

Connecting cables & enclosure — optional

We offer a complete line of transmitters and receivers, preselector-preamps, CW/VS and synthesizers for amateur & commercial use.

Request our FREE catalog. MC & Visa welcome. Allow $2 for UPS shipping.

January 1984
AEA Brings You The AMTOR Breakthrough

We are pleased to announce three new AMTOR products. Our new software package that will allow you to operate AMTOR with your CP-1 is called AMTORTEXT. A complete hardware terminal unit and AMTORTEXT software plug-in cartridge for the Commodore 64 computer is called the MICROAMTOR PATCH. We also have new applications software packages for the AMT-1 and Commodore 64 or VIC-20 computers.

AMTORTEXT is a LOW COST software package that will allow the CP-1 and Commodore 64 computer to be used as a multi-mode AMTOR TERMINAL. Compare the outstanding FEATURES and PRICE of the AT-64 (AMTORTEXT for Commodore 64) to the competition:

- KEYBOARD OVERLAY instructions (eliminates constant referral to manual)
- STATUS INDICATORS on screen
- Easy to follow MENU
- ARQ, MODE A, MASTER OR SLAVE
- FEC MODE B
- MODE L (LISTEN TO MODE A)
- SPLIT SCREEN with 2000 CHARACTER TYPE AHEAD transmit buffer
- WORD MODE for error correcting with DELKEY until space or CR is sent
- REMOTE ECHO shows characters transmitted as they are validated by other station
- easy entry of your SELCALL for automatic response to ARQ calls
- BREAK-IN MODE to interrupt sending station
- LTRs/FIGs REVERSE for assistance in MODE L synchronizing
- TEN MESSAGE BUFFERS
- PROGRAMMABLE TRANSIT DELAY can be saved to tape
- AUTOMATIC PTT
- POWERED BY HOST COMPUTER
- includes INTERFACE CABLE for AEA model CP-1 COMPUTER PATCH.

The AMTOR software TIMING ROUTINES have been written by Peter Martinez, G3PLX (father of AMTOR) which means you can be sure of having NO Synchronization problems with other AMTOR stations adhering to the established international AMTOR standard. PROPER SYNCHRONIZATION is an ABSOLUTE must for AMTOR!

NEW AMTORTEXT

MICROAMTOR PATCH is a NEW LOW-COST, HIGH-PERFORMANCE AMTOR SOFTWARE/HARDWARE computer interface package. The MICROAMTOR PATCH (model MAP-64) INCORPORATES AMTORTEXT software (described above) for the Commodore 64 computer. All circuitry and software is incorporated on a single, plug-in cartridge module featuring the following:

- TRUE DUAL CHANNEL MARK AND SPACE
- MULTI-STAGE 4 POLE, CHEBYSHEV ACTIVE FILTERS
- AUTOMATIC THRESHOLD CORRECTION for good copy when one tone is obliterated by QRM or SELECTIVE FADING
- EASY, POSITIVE Tuning with TRIPLE LED INDICATOR
- NOT a low-cost, easily "pullable" phaselocked loop detector!!!
- SWITCH SELECTED 170 Hz or WIDE SHIFT on receive
- AUTOMATIC PTT
demodulator circuitry powered by your 12 VDC supply to AVOID OVERLOADING HOST COMPUTER and for maximum EMi ISOLATION

The MicroAmTor Patch is structured for easy upgrading to the AEA CP-1 Computer Patch advanced interface unit without having to buy a different software package! Simply unplug the external computer interface cable (supplied with the MicroAmTor Patch) from the MicroAmTor Patch and plug it into the Computer Patch.

$99.95 List $69.95* C-64 AMTORTEXT

The Model MAP-64/2 incorporates the C-64 MBATEXT PROM on the same board with AMTORTEXT for low cost RTTY/CW/ASCII/AMTOR operation.

AMT-1

Applications software for C-64 or VIC-20

AEA also offers an applications software package for the Commodore VIC-20 (model AMT-1/VIC20-1) or 64 computer that is resident on a plug-in PROM CARTRIDGE and includes the INTERFACE CABLE to go between the computer and the AMT-1. KEYBOARD OVERLAY instructions are also included for easy operation without the instruction manual. The COMM-64 program (model AMT-1/C64-1) offers SPLIT SCREEN OPERATION with ten MESSAGE BUFFERS. It also offers UNATTENDED OPERATION with automatic MESSAGE RECORDING and AUTOMATIC STATION IDENTIFICATION.

a wide-range ohmmeter

Measure values from 0.1 ohms to 1000 megohms on seven ranges

The typical VOM or digital multimeter found on most workbenches simply cannot handle the extremes of resistance values most Amateurs encounter in building or repairing sophisticated electronic equipment. The usual upper limit of 20 megohms falls far short of required measurements; the usual lower limits could also be extended.

Because I needed an ohmmeter with a wider range than the one on my workbench, I decided to design and build one. But wide range would not be enough; my meter would have to be low in cost, provide relatively good accuracy, be easy to read, and offer reliable long-term calibration. Low cost was achieved by developing a simple circuit and using some junk-box components; accuracy, by including an analog instrument; easy reading, by using a single scale on a 4-1/2 inch meter, thus avoiding incorrect readings sometimes made with multiple scales; and long-term calibration, by use of a line-operated power supply instead of batteries.

I wanted an upper limit of 1000 megohms and a lower limit of 0.1 ohms. Although the least significant bit of a 3-1/2 digit DMM displays increments of 0.1 ohms, the actual resistance could be anywhere between 0.06 and 0.14 ohms for a 0.1 ohm display. On some DMMs the LSB will jump up or down one count which, of course, invalidates very low value measurements.

how it works

The circuit shown in fig. 1 employs a regulated low voltage, 1.22 volts, which is applied to the unknown resistor in series with a switch-selected standard resistor. The voltage drop across the unknown is fed to the input of one section of dual op amp, LF353. This section is connected as a voltage follower. It has the very high input resistance of $10^{12}$ ohms, which hardly loads down the unknown. Output null is obtained with adjustment of R18. The next stage, the other section of the LF353, provides an adjustable gain of a little more than 1 so that the meter can be calibrated to read full-scale with the unknown terminals open. When an unknown resistor is connected across the terminals, the meter reads down scale, reaching zero when the unknown resistor terminals, $\pm R_x$, are shorted together at the panel.

circuit details

The power supply, using a full-wave bridge rectifier and center-tapped transformer secondary, provides zener-regulated $+5$ and $-5$ volts for the LF353. An LM317T voltage regulator supplies the...
1.22 volts required for the input divider. A heat sink is used on this regulator because of the wattage dissipation on the low range. On this range, with the unknown resistor terminals shorted, 122 mA flow through the 10-ohm standard resistor. Since about 7.5 volts is dropped across the regulator, the worst-case dissipation is 7.5 volts × 122 mA or about 0.9 watts. R17 provides a minimum load of 25 mA for stable operation of the regulator.

The 10-megohm standard is paralleled across the other range standards for all switch positions, which assures an input ground return for the LF353 at all times when switching ranges. Series resistors are added to the × 10k and × 100k ranges to compensate for the 10 megohm shunting. The 1N914 diode in series with the meter prevents reverse deflections of the meter. The standard resistors should be metal film type of ±1 percent tolerance.

The null circuitry is conventional for voltage followers. For the values shown, ±4 mV maximum is developed across R11. If more null compensation is necessary with the particular LF353 used, simply increase the value of R11. The internal resistance of the meter is not critical since it is in the feedback loop. Mine had a resistance of 1200 ohms.

On the high end of range × 1M, it is important to minimize any leakage resistance across the unknown terminals, ±Rx, because such leakage would be in parallel with the resistor being measured. The schematic shows only the range resistors and pin 3 of the first LF353 connected to the positive Rx terminal. Since the common ends of the range resistors are not mounted on any terminal strip supports, but rather supported by their leads, only negligible leakage to ground exists. Consequently, pin 3 exhibits a 1012 ohm resistance to ground and thereby adds an insignificant shunting effect. Not shown, however, is PC board surface leakage from pin 3 to ground, if pin 3 were soldered (via a socket) to a PC board trace. PC board surface leakage can be minimized by using a guarding technique. This technique consists of a

---

**Figure 1:** Wide range ohmmeter schematic A) measuring circuit, and B) power supply.

**Figure 2:** PC board artwork, foil side. Cross indicates drilling location for pin 3 guard terminal. See text.

**Figure 3:** Component side of PC board.

---

54 January 1984
trace ring that completely circles pin 3 and returns it
to a low impedance point of voltage — equal to the
voltage on pin 3. This must be done without pin 3
(actually pin 3 of the socket) touching the PC board.
Isolation is accomplished by drilling a clearance hole
in the PC board so that the socket pin 3 protrudes
through the board clearance hole and, with a jumper
wire, is connected to the trace pad inside the guard
ring. The guard ring is connected to pin 2. Purists will
be quick to point out that the guard ring should be
connected to pin 1 because pin 2 has a higher im-
pedance than pin 1. They are correct; this is only a
quasi-guard solution, but for this application, it is
sufficient.

construction

The power supply components are mounted on a
3-3/4 x 4-1/2 inch (9.53 x 11.4-cm) perfboard
which is mounted on the meter studs. The PC board
containing the measuring circuit components
is mounted on the perfboard with two 1/4-inch stand-
off spacers. The range switch, mounted on the front
panel, is a 7-station push-button type (I prefer this
rather than a rotary type switch.) Fig. 2 shows the
foil side of the PC board and fig. 3 shows the ar-
rangement of parts on the component side of the
board. Fig. 4 shows the placement of all components
as seen in the view of the rear of the ohmmeter while
fig. 5 shows the front view.

The meter scale is non-linear, as shown in fig. 6.
At midscale the readings are equal to the standard re-
sistors for the various ranges. To draw the scale a
simple calculation can be made, knowing the meter’s
full-scale deflection in degrees. (Mine was 101
degrees.) The formula is:

\[
\frac{B}{A + B} \times C = \text{degrees deflection for } R_X = B
\]

where \(A\) = standard resistor
\(B\) = unknown resistor
\(C\) = full-scale deflection in degrees

For example, using the \(\times 1\k\) range \(A = 10\k\) and \(C = 101^\circ\), a 4\k unknown will read:

\[
\frac{4\k}{10\k + 4\k} \times 101^\circ = 28.86^\circ
\]

In building the prototype unit, I decided to mount
the gain control on the front panel just in case some
slight change in gain would be needed to correct for
component value changes with time. So far I haven’t
found any reason to use it.

I chose to mount the ohmmeter on the back of my
workbench in a central position from which four-foot
long leads would reach test points where I could read
the meter without parallax error.

calibration

Calibration is simple. Adjust the nulling pot for
zero output of the voltage follower stage with the in-
put terminals shorted. Then adjust the gain control
for full-scale deflection.
Parallel, TTL Input I/O “Selectric”
TYPEWRITER / PRINTER

Removable from working systems these fantastic machines have built-in driver and decoder circuitry and take TTL level 6-bit character plus 4-bit function input signals easily driven by most any micro. Use as typewriter with add repeat circuitry or as a RS-180 printer or both. Requires 115 60Hz for typewriter motor 5 VDC for TTL and 24 VDC for solenoids. Table Top style case. Each Selectric I/O machine is complete and in operational condition. Includes schematics, data case, platen, and ribbon.

$329.00 ea.

And 3.75 for Packaging and Handling. First Shipping on December.

SAVE!! Untested version of the above. otherwise whole & complete. May require some service.

$279.00 ea.

Diablo Daisy Printer Hi-Type II

1355-WP Word Processing Daisy Printer

Pre-owned, TESTED & Operational!
Uses Kenro Metal Wheels or Plastic Wheels
Original DIM Interface (Daisy Interface)
Requires 117V (5A & 9VDC in SA
Positional access to 1-120 "Horiz. 1/48" Vertical"

USED BY Xerox, NANO & OTHERS
Heavy Duty Printwheel Motor and 15" Frame

These fabulous daisy printers feature 35-60cps. 10 & 12 pitch as well as proportional space and letter cartridges. Only a power supply and interface are required for full printer capability. Fully tested and operational, ready to configure for the interface of your choice. Platen and I/O data included.

$549.00 ea.

fig. 5. Front panel view of ohmmeter.

fig. 6. Typical meter scale layout.

operation

Switch on the power; the meter should deflect to full-scale. Connect the test leads across the unknown resistor, selecting the range which gives a reading below half-scale because the divisions are larger on the lower part of the meter dial.

If, on the x1M range, jitter occurs at full-scale with the test leads not connected to an unknown, reverse the line plug. When using the x1 range the resistance of the test leads introduces a small error which can be measured and subtracted from any fractional ohm measurement. Simply note the reading obtained with the test leads shorted at their tips. Then subtract this reading from the unknown resistor reading.
EXCLUSIVE 1 YEAR LIMITED WARRANTY! COMPARE!

THE 4000 SERIES

PCS-4300 70-cm FM Transceiver

PCS-4500 6-m FM Transceiver

PCS-4800 10-m FM Transceiver

COMING SOON
PCS-4200 1 1/4-m FM Transceiver

PCS-300 2m Handheld FM Transceiver 142-149.995 MHz

- WIDE FREQUENCY COVERAGE: PCS-4000 covers 142.000-149.995 MHz in selectable steps of 5 or 10 kHz. PCS-4200 covers 220.000-224.995 MHz in selectable steps of 5 or 20 kHz. PCS-4300 covers 440.000-449.995 MHz in selectable steps of 5 or 25 kHz. PCS-4500 covers 50.000-53.995 MHz in selectable steps of 5 or 10 kHz. PCS-4800 covers 28.000-29.990 MHz in selectable steps of 10 or 20 kHz.

- CAP/MARS BUILT IN: PCS-4000 includes coverage of CAP and MARS frequencies.

- TINY SIZE: Only 2 1/2" H x 5 1/4" W x 6 3/4" D. COMPARE!

- MICROCOMPUTER CONTROL: At the forefront of technology!

- UP TO 8 NONSTANDARD SPLIT: Ultimate versatility. COMPARE!

- 16-CHANNEL MEMORY IN TWO 8-CHANNEL BANKS: Retains frequency and standard simplex or plus/minus offsets. Standard offsets are 600 kHz for PCS-4000, 1.6 MHz for PCS-4200, 5 MHz for PCS-4300, 1 MHz for PCS-4500, and 100 MHz for PCS-4800.

- DUAL MEMORY SCAN: Scan memory banks either separately or together. COMPARE!

- TWO RANGES OF PROGRAMMABLE BAND SCANNING: Limits are quickly reset. Scan the two segments either separately or together. COMPARE!

- FREE AND VACANT SCAN MODES: Free scanning stops 5 seconds on a busy channel; auto-resume can be overridden if desired. Vacant scanning stops on unoccupied frequencies.

- DISCRIMINATOR SCAN CENTERING (AZDEN EXCLUSIVE PATENT): Always stops on frequency.

- TWO PRIORITY MEMORIES: Either may be instantly recalled at any time. COMPARE!

- NICAD MEMORY BACKUP: Never lose the programmed channels!

- FREQUENCY REVERSE: The touch of a single button inverts the transmit and receive frequencies, no matter what the offset.

- ILLUMINATED KEYBOARD WITH ACQUISITION TONE: Unparalleled ease of operation.

- BRIGHT GREEN LED FREQUENCY DISPLAY: Easily visible, even in direct sunlight.

- DIGITAL SRF METER: Shows incoming signal strength and relative power output.

- BUSY-CHANNEL AND TRANSMIT INDICATORS: Bright LEDs show when a channel is busy and when you are transmitting.

- FULL 16-KEY TOUCHTONE PAD: Keyboard functions as autotune when transmitting (except in PCS-4800).

- PL TONE: Optional PL tone unit allows access to private-line repeaters. Deviation and tone frequency are fully adjustable.

- TRUE FM: Not phase modulation. Unsurpassed intelligibility and audio fidelity.

- HIGH/LOW POWER OUTPUT: 25 or 5 watts selectable in PCS-4000; 10 or 1 watt selectable in PCS-4200, PCS-4300, PCS-4500, and PCS-4800. Transmitter power is fully adjustable.

- SUPERIOR RECEIVER: Sensitivity is 0.2 μV or better for 20-dB quieting. Circuits are designed and manufactured to rigorous specifications for exceptional performance, second to none. COMPARE!

- REMOTE CONTROL MICROPHONE: Memory A-1 call, up/down manual scan, and memory address functions may be performed without touching the front panel! COMPARE!

- OTHER FEATURES: Dynamic microphone, rugged built-in speaker, mobile mounting bracket, remote speaker jack, and all cords, plugs, fuses, and hardware are included.

- ACCESSORIES: CS-7R 7-amp ac power supply, CS-4 SR 4.5-amp ac power supply, CS-AS remote speaker, and Communications Specialists SS-32 PL tone module.

- ONE YEAR LIMITED WARRANTY!
TRADE IN YOUR OLD RTTY TU FOR A NEW FLESHER TU-470

The Flesher Corporation dares to make an offer you can't refuse. Now you can move up to a high quality RTTY terminal unit without throwing away money you have already invested. Your present name brand RTTY terminal unit is worth up to full retail value* when you trade up to a Flesher TU-470 priced at $499.95. Most RTTY/CW software works with the TU-470 without modification. So while the offer lasts, call our toll free number for more information and a no-obligation estimate of your trade-in value. But act soon; this offer won't last long.

*LIMITED TO $200.00

Here are just a few of the many fine features the TU-470 offers:

- TTL & RS-232c compatible I/O for computer remote control
- RTTY communication rates up to 300 baud
- Two tone RTTY detection with six pole active filters
- Three popular RTTY shifts
- Built-in 20 or 60 mA loop
- Signal balance circuit for single tone detection
- Threshold control
- Anti-space
- Mark hold
- Scope outputs
- Independent reverse shift controls for REC and XMIT.
- Six pole active filter CW demodulator
- Remote controlled bi-polar keying outputs for CW and PTT.

SUGGESTED RETAIL PRICE ONLY $499.95
(Add $4.50 for UPS shipping and handling in U.S.A. plus $1.75 for all COD orders.) Visa, Mastercard, COD, or check accepted.

RF POWER ENGINEER
R & D TECHNICIAN

ETO is growing. We're applying microprocessor-controlled rf power to medical imaging and radio communications in major new multi-year programs.

If you have proven ability in HF/VHF power and seek challenge with prompt rewards, we may have the perfect opportunity for you.

Excellent salary and benefits include profit sharing and Rocky Mountain living.

Please send resume to

DESIGN EVOLUTION IN RF P.A.'s

Now with GaAs FET Preamp

- Linear (all mode) RF power amp with automatic T/R switching (adjustable delay)
- Receive preamp option, featuring GaAs FETs (lowest noise figure, better IMD). Device NF typically .5 dB
- Thermal shutdown protection incorporated
- Remote control available
- Rugged components and construction provide for superior product quality and performance
- Affordably priced offering the best performance per dollar
- Designed to ICAS ratings, meets FCC part 97 regulations
- 1 year transistors warranty
- Add $5 for shipping and handling (Cont. U.S.). Calif. residents add applicable sales tax.

Specifications/price subject to change

1. Models with G suffix have GaAs FET preamps. Non-G suffix units have no preamp.
2. Covers full amateur band, Specify 10 MHz Bandwidth for 420-450 MHz Amplifier.

IC-471A
The New Deluxe 430-450 MHz Base Transceiver from ICOM

32 full function memories / subaudible tones / PLL locked to 10 Hz / two color fluorescent display / RIT readout / scanning / new size.

32 Memories. Each memory holds frequency, mode, offset direction, offset frequency and subaudible tone for easy return to an oft used frequency or for remembering a new repeater or simplex frequency.

Subaudible Tones. Subaudible tones are selected by rotating the main tuning knob. These tones may then be stored into memory along with the frequency, offering ease of operation.

Phase Lock Loop. Extremely low noise and good signal to noise ratio PLL design allows the IC-471A to lock to 10 Hz for extreme accuracy.

New Display. ICOM's new easy-to-read two color fluorescent transceiver situation display shows frequency, mode, offset direction, VFO in use, memory channel, and RIT offset direction and amount.

Scanning. Scanning of memories, programmable band scan, and mode scanning are available and easy to use.

New Size. Only 11\(\frac{1}{2}\)"W x 4\(\frac{1}{4}\)"H x 10\(\frac{3}{4}\)"D the IC-471A is styled to look good and engineered for ease of operation.

IC-471A
The World System

ICOM America, Inc., 2112-116th Ave NE, Bellevue, WA 98004 (206) 454-6155 / 3331 Towerwood Drive, Suite 307, Dallas, TX 75234 (214) 620-2784
All stated specifications are approximate and subject to change without notice or obligation. All ICOM radios significantly exceed FCC regulations limiting spurious emissions.
ICOM IC-751
The New Standard of Comparison

NEW Competition Grade Transceiver!

ICOM is proud to announce the most advanced amateur transceiver in communications history. Based on ICOM's proven high technology and wide dynamic range HF receiver designs, the IC-751 is a competition grade ham receiver, a 100kHz to 30 MHz continuous tuning general coverage receiver, and a full featured all mode solid state ham band transmitter, that covers all the new WARC bands.

And with the optional internal AC power supply, it becomes one compact, portable/field day package.

Receiver. Utilizing an ICOM developed J-FET DBM, the IC-751 has a 105dB dynamic range. The 70.4515MHz first IF virtually eliminates spurious responses, and a high gain 9.0115MHz second IF, with ICOM's PBT system, gives the ultimate in selectivity. A deep IF notch filter, adjustable AGC and noise blanker (can be adjusted to eliminate the woodpecker), audio tone control, plus RIT with separate readout provides easy-to-adjust, clear reception even in the presence of strong QRM or high noise levels. A low noise receiver preamp provides exceptional reception sensitivity as required.

Transmitter. The transmitter features high reliability 2SC2904 transistors in a low IMD (-38dB 100W), full 100% duty cycle (internal cooling fan standard), 12 volt DC design. Quiet relay selection of transmitter LPF's, transmit audio tone control, monitor circuit (to monitor your own CW or SSB signal), XIT, and a high performance speech processor enhance the IC-751 transmitter's operation. For the CW operator, semi break-in or full QSK is provided for smooth, fast break-in keying.

Dual VFO. Dual VFO's controlled by a large tuning knob provide easy access to split frequencies used in DX operation. Normal tuning rate is in 10Hz increments and increasing the speed of rotation of the main tuning knob shifts the tuning to 50Hz increments automatically. Pushing the tuning speed button gives 1kHz tuning. Digital outputs are available for computer control of the transceiver frequency and functions, and for a synthesized voice frequency readout.

32 Memories. Thirty two tunable memories are provided to store mode, VFO, and frequency, and the CPU is backed by an internal lithium memory backup battery to maintain the memories for up to seven years. Scanning of frequencies, memories and bands are possible from the unit, or from the HM12 scanning microphone. In the Mode S mode, only those memories with a particular mode are scanned; others are bypassed. Data may be transferred between VFO's, from VFO to memories, or from memories to VFO.

Standard Features. All of the above features plus FM unit, high shape factor FL44A, 455 Khz SSB filter, full function metering, SSB and FM squelch, convenient large controls, a large selection of plug-in filters, and a new high visibility multi-color fluorescent display that shows frequency in white, and other functions in white or red, make the IC-751 your best choice for a superior grade HF base transceiver.

Options. External frequency controller, external 915 power supply, voice synthesizer, computer interface, internal power supply, high stability reference crystal (less than ±10Hz after 1 hour), HM12 hand mic, desk mic, filter options: SSB: FL70, CWN: FL52A, FL53A, FL32, FL63, AM: FL33.

ICOM America, Inc. 2112-116th Ave NE, Bellevue, WA 98004 (206)454-2155 / 3331 Towerwood Drive, Suite 307, Dallas, TX 75234 (214)620-2780

All stated specifications are approximate and subject to change without notice or obligation. All ICOM radios significantly exceed FCC regulations limiting spurious emissions.
April 27, 28, 29, 1984
Hara Arena and Exhibition Center — Dayton, Ohio
Meet your amateur radio friends from all over the world at the internationally famous Dayton HAMVENTION.

Seating will be limited for Grand Banquet and Entertainment on Saturday evening so please make reservations early. Harry Dannals, W2HD, Past President ARRL, will be featured speaker.

If you have registered within the last 3 years you will receive a brochure in January. If not, write Box 44, Dayton, OH 45401.

Nominations are requested for Radio Amateur of the Year and Special Achievement Awards. Nomination forms are available from Awards Chairman, Box 44, Dayton, OH 45401.

For special motel rates and reservations write to Hamvention Housing, Box 1288, Dayton, OH 45402. NO RESERVATIONS WILL BE ACCEPTED BY TELEPHONE.

All other inquiries write Box 44, Dayton, OH 45401 or phone (513) 433-7720.

ALL Flea Market spaces will be sold in advance ONLY. NO spaces sold at gate. Entrance for set-up available starting Wednesday. Special Flea Market telephone (513) 223-0923.

Bring your family and enjoy a great weekend in Dayton.
Sponsored by the Dayton Amateur Radio Association, Inc.

SANTEC presents the smarter handhelds
FOR 144 VHF, 220 VHF & 440 UHF

SANTEC Handhelds just got a little smarter, with new computer-control software designed by U.S. Hams who are also professional programmers. Now SANTEC Handhelds, which were the first to offer variable crystal diode tuning in a handheld, first to offer you thick-film technology, first to provide 3.5W as a selectable handheld option and first to give you the time of day on a handheld read-out, have made another user-friendly leap forward in the logical progression of computer-controlled handhelds.

Now three SANTEC Handhelds can lock out selected memory channels from the memory scan, allowing you to check your favorite frequencies much faster, without interruption from less commonly used ones or from unprogrammed memory channels. SANTEC Handheld’s new operating programs now allow you to store variable offset values in all 10 user-written memory channels; and, as always with SANTEC Handhelds, your stored offset automatically comes back when you select a channel through the memory mode, and the plus or minus indication shows on the LCD display.

Other new features are the provision in Memory 9 for split memory offset operation, for those really unusual offset situations, and the capacity for hardware storage of a special PL tone for each memory channel (requires an optional encoder, available December, 1983). The new SANTEC Handhelds will also accept the keyboard input of all frequencies as either short, fast 4-digit numbers or the familiar 6-digit versions: your SANTEC Handheld is smart enough to know what you want, either way.

The handhelds with the most now have more for you. Don’t you dare settle for anything less: get your hands on a SANTEC Handheld today!

Shown above is just one of the three new smarter handhelds from SANTEC: the ST-142 VHF, the ST-442 UHF, and the ST-222 VHF. Owners of earlier SANTEC models ST-144, ST-440 and ST-220, please write for information on how your SANTEC Handheld can be upgraded to the new state of the art in handheld transceivers.

antenna "neutralization"

As one cynic put it, "It’s hard to be loud on 40 meters when you live on a city lot." Many mini-antennas have been designed for 40 meters (and for 80 meters, too) and some of them seem to work. However, they all pale into insignificance when measured against a full-size beam antenna.

So where does that leave the majority of hams who can’t erect a big three-element 40-meter Yagi on a 150-foot tower? The only answer for them is to use a mini-antenna that works.

One knowledgeable Amateur who has wrestled with this problem is Les Moxon, G6XN, who concluded that mini-beams constructed with close spacing (to conserve boom length) could never be optimized because the elements were overcoupled. His solution to this problem was to eliminate the excess coupling by means of a neutralization technique (fig. 1).

When Les was visiting in the San Francisco Bay area recently, I had the opportunity to speak with him about the technique. By the time he left, my head was abuzz with interesting ideas for mini-beam antennas for the low-frequency bands.

Alas, inertia and lack of free time prevented anything from being done. However, my good friend George Badger, W6TC, grasped the idea, combined it with some original thinking, and developed a mini-quad antenna for 40 meters that provides both good gain and excellent front-to-back ratio.

George had built a compact 40-meter quad that worked, after a fashion. Gain over a dipole was questionable, and the array didn’t seem to have any front-to-back ratio. Bandwidth was very sharp, and the antenna operated over only a small segment of the 40-meter band before the SWR on the transmission line became too high for proper transmitter operation.

He solved the bandwidth problem with a simple tuning device for the quad loops, but the gain and front-to-back problems remained unsolved until G6XN proposed the antenna neutralization method.

Without going into construction details, the neutralization concept is shown in (fig. 1). It can be applied equally well to a close-spaced Yagi array (fig. 2). In essence, a capacitor is cross-connected from a driven element to a parasitic element and then adjusted for best front-to-back ratio of the antenna. Maximum forward gain and best front-to-back ratio seem to occur at the same setting of the capacitor. The tap point of the capacitor on the antenna elements seems to be less critical than the value of the capacitor. For W6TC’s quad, the capacitance value is optimized for best performance.

Does the neutralization scheme work? W6TC’s five-band DXCC proves that you can be loud on 40 meters when you live on a city lot! I’ll provide more details on this interesting antenna development at a later date. Meanwhile, there’s no

Jan 1984
reason why you can’t experiment with antenna neutralization on your mini-beam. I’d be interested in hearing from readers who try this unusual technique.

the coax jungle

Sometimes a little knowledge is worse than none at all. I’ve heard a lot of plausible stories about coax cables and I know that plenty of junk coax is being sold to unsuspecting buyers. But I didn’t realize what a “jungle” exists with regard to the millions of miles of coax cable sold each year to hams, the military, industry, CBers, and others. The military, at least, usually knows what it gets for its money, as flexible coax cables are bought to a strict specification (MIL-17D or E). But how about the rest of us?

This all came to a head when I measured the loss of my coax transmission line running from station to antenna. According to all the published charts, my line loss at 14 MHz should be about 0.8 dB per hundred feet. My measurements, done with laboratory-type instruments, showed a loss of nearly 1.35 dB. What was the problem? Was the cable growing old? Or was it inferior cable to begin with? What should be the expected life of a coax cable? Five years? Twenty years? Forever?

a long phone call

Why not go directly to the coax cable manufacturer? One day, I did just that. I called one of the largest cable manufacturers in the United States and spoke at length to one of the production engineers who was an expert on coax cable manufacture.

I first asked about “military specification” cable. He said that if you want the best cable, that was the type to buy, but that it was also the most expensive because of the exhaustive tests the cable must pass before it gains military approval.

My unseen friend mentioned that there were perhaps a dozen large, top-notch coax cable manufacturers in the United States and about the same number of smaller, but good manufacturers. And finally, there were numerous “garage shop” operators who made up coax on demand to any specification. “After all,” he said, “a coax cable machine isn’t that expensive.”

Part of the cost of the cable is the exhaustive tests and inspections demanded by the military; sometimes the cost of certification exceeds the cost of manufacturing. If you don’t have to meet military specifications, the costs drop sharply...especially if you use second-hand cable machinery.

Consider RG-8/U cable, which is not in military use today. (Military gear is designed for 50-ohm termination, and the old style RG-8/U and newer RG-8A/U cables were 52 ohms.) “Of course, if you want,” said the cable company spokesman, “we’ll manufacture RG-8/U or RG-8A/U to a military specification, but we’ve had no call for that.”

RG-8/U and RG-8A/U were replaced by RG-213/U (50 ohm) cable made to MIL-C-17D or E specifications. The specifications call for an inner conductor made of seven strands of bare copper wire, each strand 0.0296 inch in diameter. The dielectric is first-grade polyethylene, with no dirt or pinholes in it. One untinned copper braid jacket is used, providing greater than 90 percent coverage. He pointed out proudly that his particular non-military RG-8A/U had 97 percent coverage. The outer jacket was polyvinylchloride Ila, noncontaminating material. And the cable sold for well over 70 cents a foot in small quantities.

“What about coax that sells for about 30 cents a foot?” I asked. Well, that was a long story. Plenty of price-cutting is going on, but it is possible to manufacture an inferior grade of coax that looks pleasing to the casual observer. He had seen cheap cable with less than 60 percent braid coverage for sale. Moreover, the size of the braid wire was reduced from B.S. No. 36 to B.S. No. 36.5 or B.S. No. 37. (“You can buy wire any diameter you want,” he emphasized.)

The next price-cutting technique is to use a less expensive jacket, such as used on the older RG-8/U cables. These jackets gradually contaminated the copper shield and he classified this old material as PVC-1. He’d seen cable like this one on the market.

Another cost-cutting step in making a cheap cable is to reduce the diameter and number of wires in the center conductor, and to also decrease the twist, or turns-per-inch, of the conductor. And, finally, a low grade of polyethylene insulation can be used. Some cheap cables use all these cost-cutting techniques.

During the manufacturing process, costs could be shaved if no attention were paid to the concentricity of the cable. Letting the center conductor “wander” a bit meant that less cable was rejected in final inspection and an older cable-making machine could be used for the job.

When the cable was completed, it might look like the real thing, but losses would be higher and cable life would be shorter than that of high-quality cable, and the impedance would probably wander well away from 50 ohms.

The engineer sighed. “I think much of the cable on the ham and CB market is sub-par quality; as long as price is the determinant, that’s the way it’s going to be.”

To summarize, he rapidly summed up his observations for me:

![Diagram of a compact two-element Yagi beam with neutralization capacitor.](image)
Avoid the risk of buying low quality electronic equipment!

- Choose from over 20,000 pieces of electronic equipment that carry not only a full warranty, but also a 5 day return privilege.
- Call Metric Resources and buy high technology products from the leading manufacturers, at the lowest prices.
- Metric Resources is the sales division of the world's largest electronic test equipment rental company, Leasametric.
- This means that you can now buy equipment from the Leasametric rental inventory, guaranteed to meet the manufacturer's original specifications.

**TERMS AND CONDITIONS**

1. The primary source of equipment for sale by Metric Resources is from the inventory of Leasametric, Inc., and has been rented prior to sale unless otherwise specifically listed as "new in the box".
2. Every instrument sold is professionally calibrated and is guaranteed to meet the manufacturer's original specifications.
3. Warranty is 90 days on electronic test equipment and 30 days on data terminals and electromechanical equipment, unless otherwise noted.
4. Payment terms are 1% discount for cash payment within 10 days, net 30 days, F.O.B. Metric Resources Inventory Center.
5. All equipment offered is subject to prior sale.
6. Prices quoted are for sales within the Continental United States and are subject to change without notice. All state and local taxes are the responsibility of the purchaser.

Call today and put your purchase on your Master Card or Visa.
Plan Now To Attend The Most "OUT OF THIS WORLD" Event In The History Of Ham Radio!

COME TO THE ARRL 1984 NATIONAL CONVENTION IN NEW YORK, the world's greatest city, at the New York Statler July 20-22. Along with the convention's fantastic parties, technical and operating seminars, League committee meetings, banquet, DX gatherings and manufacturers' displays, you and your family can enjoy all there is to do in New York, the cultural capital of the world!

FOR A TRULY "OUT OF THIS WORLD" EXPERIENCE we'll be celebrating both the 15th Anniversary of man's first moon landing AND the first off-world amateur radio operation during the STS-9 Spacelab-1 mission. Our special guest will be astronaut DR. OWEN GARDIOTT, W5LFL, first ham to operate from space! You can meet W5LFL in person, at the Moon Landing Anniversary Party on Friday evening, July 20th, AND hear him speak at the Banquet on Saturday evening, July 21st.

IMAGINE, THE MOST IMPORTANT ARRL NATIONAL EVER HELD...AND YOU CAN BE THERE! Register now to assure your room and banquet reservations. For detailed information and registration forms, SASE to Mike Troy, AJ1J, R.R. 4 - Box 19C, Pound Ridge, NY 10576.

Say you saw it in Ham Radio
1. Be careful of RG8/U, RG-8A/U, or "RG-8/U type" cable. It has no controlling military specifications. RG-8A/U made by a reputable manufacturer — with its name and type number on it in addition to the RG nomenclature is probably OK...but it is almost as expensive to buy as the premium stuff.

2. Look up the specifications for the cable you intend to buy, and examine the cable before you buy it. Does it have the proper number of center strands? Is the inner dielectric uniform with no blemishes or spots? Does it have complete, or nearly complete, braid coverage? Does it have a noncontaminating jacket? And most important of all, is it made by a reputable manufacturer? Be suspicious of underpriced cable because "there ain't no free lunch."

3. If you are starting out fresh, buy RG-213/U cable (50 ohms) which also has the manufacturer's name and type number on it instead of RG-8/U type cable (52 ohms). It may be nitpicking, but today's RG-213/U cable standard is 50 ohms. It is a military-approved, properly-manufactured cable. Again, make sure it is made by a reputable manufacturer. You can then be certain the cable is what is claimed to be and know that it has been tested.

---

**how long will it last?**

I'd heard it said that coax cable should be replaced every few years, so I asked my friend if that was so. He replied that all cables deteriorate at greater or lesser rates depending upon use and abuse. Cable failure occurs when one or more specifications of the cable no longer meets the needs of the user. Sometimes the impedance of the cable changes; sometimes the cable loss becomes intolerable; sometimes the velocity of propagation changes to a degree.

I told the engineer that my RG-213/U, which was about 15 years old, had increased in loss by a measurable amount over the years and asked whether I should scrap it and buy new cable.

"That's up to you," he replied. "Coax cable doesn't fall apart all at once like the One Horse Shay. Deterioration is gradual. If you don't mind the increased loss, why spend the money to replace the cable? If you require every watt, you'd better get rid of it."

"Then this story of a five-year life, or a fifteen-year life for coax is unsubstantiated?" I asked. "That's right," he replied. He said he thought the story had begun because in the past, some branches of the military had routinely junked coax cable after it had been stored for a number of years. He didn't think that was true today.

"Well, if I were operating on 80 meters," he added, "I wouldn't worry too much about the grade of coax I had. Losses are relatively low at that frequency even on old, junky cable. At 20 meters, however, I would start to pay attention to cable loss. And at 2 meters, I would examine the coax I bought very carefully. I would measure the velocity of propagation of each section if I made matching transformers, and I would check cable loss every year or so. As you go higher in frequency, you can't be too careful!"

His parting shot was to remind me that large quantities of imported cable which have recognized U.S. markings but whose manufacturing specifications are unknown are now entering the market. "Have fun when you buy your next length of coax cable," he chided as we hung up.

Also available for remote site linking, crossband, and remote base.

FEATURES:
- SENSITIVITY SECOND TO NONE; TYPICALLY 0.15 uV ON VHF, 0.3 uV ON UHF.
- SELECTIVITY THAT CAN'T BE BEAT! BOTH 8 POLE CRYSTAL FILTER & CERAMIC FILTER FOR GREATER THAN 100 dB AT ± 12KHZ. HELICAL RESONATOR FRONT ENDS. SEE R144, R220, AND R451 SPECS IN RECEIVER AD BELOW.
- OTHER GREAT RECEIVER FEATURES: FLUTTER-PROOF SQUELCH, AFC TO COMPENSATE FOR OFF-FREQ TRANSMITTERS, SEPARATE LOCAL SPEAKER AMPLIFIER & CONTROL.
- CLEAN, EASY TUNE TRANSMITTER; UP TO 20 WATTS OUT (UP TO 50W WITH OPTIONAL PA).

HIGH QUALITY MODULES FOR REPEATERS, LINKS, TELEMETRY, ETC.

HIGH-PERFORMANCE RECEIVER MODULES

R144 Shown

- R144/R220 FM RCVRs for 2M or 220 MHz. 0.15uV sens., 8 pole xtal filter & ceramic filter in H, helical resonator front end for exceptional selectivity, more than -100 dB at ± 12 kHz, best available today. Flutter-proof squelch. AFC tracks drifting xmtxs. Xtal oven avail. Kit only $138.
- R451 FM RCVR Same but for uhf. Tuned line front end, 0.3 uV sens. Kit only $138.
- R76 FM RCVR for 10M, 6M, 2M, 220, or commercial bands. As above, but w/o AFC or hel. res. Kits only $118. Also avail w/4 pole filter, only $98/k.
- R110 VHF AM RECEIVER kit for VHF aircraft band or ham bands. Only $98.
- R110-259 SPACE SHUTTLE RECEIVER, kit only $98.

- T51 VHF FM EXCITER for 10M, 6M, 2M, 220 MHz or adjacent bands. 2 Watts continuous, up to 2½ W intermittent. $68/k.
- T451 UHF FM EXCITER 2 to 3 Watts on 450 ham band or adjacent freq. Kit only $78.
- VHF & UHF LINEAR AMPLIFIERS. Use on either FM or SSB. Power levels from 10 to 45 Watts to go with exciters & xmtg converters. Several models. Kits from $78.
- A16 RF TIGHT BOX Deep drawn alum. case with tight cover and no seams. 7 x 8 x 2 inches. Designed especially for repeaters. $20.

TRANSMITTERS

ACCESSORIES

- COR KITS With Audio mixer, speaker amplifier, tail & time out timers. Kit only $38.
- CWID KITS 158 bits, field programmable, clean audio, rugged TTL logic. Kit only $68.
- DTMF DECODER/CONTROLLER KITS. Control 2 separate on/off functions with touchtones*, e.g., repeater and autopatch. Use with main or aux. receiver or with Auto-patch. Only $90

- HELICAL RESONATOR FILTERS available separately on pcb w/connectors. HRF-144 for 143-150 MHz $38 HRF-220 for 213-233 MHz $38 HRF-432 for 420-450 MHz $48

Tell 'em you saw it in HAM RADIO!
NEW LOW-NOISE PREAMPS

New low-noise microwave transistors make preamps in the 0.9 to 1.0 dB noise figure range possible without the fragility and power supply problems of gas-fet's. Units furnished wired and tuned to ham band. Can be easily retuned to nearby freq.

ECONOMY PREAMPS

Our traditional preamps, proven in years of service. Over 20,000 in use throughout the world. Tuneable over narrow range. Specify exact freq. band needed. Gain 16-20 dB. NF = 2 dB or less. VHF units available 27 to 300 MHz. UHF units available 300 to 650 MHz.
- P30K, VHF Kit less case $18
- P30W, VHF Wired/Tested $33
- P432K, UHF Kit less case $21
- P432W, UHF Wired/Tested $36

HELICAL RESONATOR PREAMPS

Our lab has developed a new line of low-noise receiver preamps with helical resonator filters built in. The combination of a low noise amplifier similar to the LNA series and the sharp selectivity of a 3 or 4 section helical resonator provides increased sensitivity while reducing intermod and cross-band interference in critical applications. See selectivity curves at right. Noise figure = 1 to 1.2 dB. Gain = 12 to 15 dB.

REPEAT OF A SELLOUT!

SAVE A BUNDLE ON VHF FM TRANSCEIVERS!

FM-5 PC Board Kit - ONLY $178
complete with controls, heatsink, etc.
10 Watts, 5 Channels, for 2M or 220 MHz.

For SSB, CW, ATV, FM, etc. Why pay big bucks for a multi mode rig for each band? Can be linked with receive converters for transceive.

2 Watts output vhf. 1 Watt uhf.

VHF & UHF LINEAR AMPLIFIERS. Use with above. Power levels from 10 to 45 Watts. Several models, kits from $78.

VALUE LEADER:

1. Exceptional quality and low prices due to large volume.
2. Fast delivery; most kits shipped same day.
3. Complete, professional instruction manuals.
4. Prompt factory service available and free phone consultation.
5. In business 21 years.
6. Sell more repeater modules than all other mfrs. and have for years. Can give quality features for much lower cost.
Electronic pollution raises new interest in plastic shielding

This two-part primer on plastics discusses their use in suppressing the undesired effects of EMI/RFI (emitted electromagnetic interference and received radio frequency interference). Part 1 examines methods of EMI/RFI suppression; part 2 reviews the various methods of testing shielding effectiveness that employ RF techniques familiar to most Amateurs. Before delving into a discussion of methods of EMI/RFI suppression, let’s see just what this interference is, what its adverse effects are, and why there seems to be a sudden surge of interest in this area despite what appeared to be little or no concern in years past.

Intense foreign competition has caused American manufacturers of electronic equipment to cut costs dramatically; as a result, metal cases have often been replaced with less expensive plastic cases. Plastics are basically insulators; consequently they provide virtually no EMI shielding unless they are specially treated.

electronic pollution

Ten years ago there was only a small fraction of the number of electronic devices now available to consumers: electronic watches, calculators, home computers, video tape recorders and games, electronic toys, CB radios, microwave ovens, thermostats and home security devices, and a variety of controls on new cars. All of these devices emit electromagnetic radiation. In addition, the emphasis on portability in many of these items means that prolonged battery life through power reduction techniques — such as using switching voltage regulated rather than linear voltage regulated power supplies — has assumed far greater importance. Granted, the switches are about twice as efficient as the linears, but because of their inherent mode of operation, i.e., switching current into an inductor, they are veritable EMI generators. Consequently, shielding becomes essential.

pollution effects

According to FCC chairman Mark Fowler, the number of electronic interference complaints now exceeds 80,000 per year. For example, communications at an East Coast airport were hampered by interference from a "noisy" cash register in a drug store a mile away. In a western state, police communications at 42 MHz were disrupted by interference from coin-operated video arcade games. A home computer was found to affect its owner’s TV as well as sets throughout the neighborhood. A fleet of new passenger buses designed for urban use were delivered, but during a test drive a driver tried to brake as

By Vaughn D. Martin, 114 Lost Meadows, Cibolo, Texas 78108
he went downhill and was astonished to discover he had no brakes until he reached bottom. Why? Because the microprocessor-controlled anti-skid devices controlling the brakes had been rendered useless by a commercial TV station's signal lobed in the direction of that particular hill. Once the electronic housings in the buses were shielded, their brakes worked.

**background on FCC rule-making**

On April 23, 1976, the FCC began a rulemaking proceeding (referred to as Docket 20780, Part 15, Subpart J) for setting realistic limits on VHF and UHF frequency emissions. The law included six categories: class, definitions, emission limits, verification, certification, labeling, and dates of compliance in dealing with radiated EMI/RFI in electronic and electrical industrial devices. In January 1979, a major computer manufacturer petitioned the FCC to relax some of these proposed standards. In response, the FCC relented on a few minor changes and rescheduled the July 1, 1980 compliance date. Other proposals presented are under consideration as well. While class A products (industrial electronic devices) are of interest, most concern seems to be focused on class B products: personal computers, electronic games and similar consumer items. (Certain inexpensive electronic games operating at frequencies less than 495 kHz are exempt from the new FCC ruling.)

Emission limits on class B devices are about three times as stringent as those placed on class A industrial products. Note in figs. 1 and 2 how class A and B limits compare with the West German or generally accepted European standard, the VDE. The German post office has placed half-page ads in newspapers pointing out that items not meeting the specifications contained in the VDE regulation will not have a government proof number. Purchasers of devices without such numbers are liable to prosecution for electronic pollution; therefore, if an American product is to be marketed in West Germany it must be very EMI-proof. But the FCC is tightening up on emissions. For example, as of October 1, 1983, all manufacturers of class A and B products became subject to the FCC's request for random sampling of

THE BEST!

...Since 1920

Whether sending QSL's or locating old friends, the new 1984 CALLBOOKS are a "must" for the active amateur. Respected for accuracy since the beginnings of amateur radio, the U.S. and Foreign CALLBOOKS list the address information for over 800,000 hams around the world in an easy-to-use format. Not simply a reprint of license records, CALLBOOK listings are taken from our own extensive master files, updated continuously to bring you the latest information available.

As an added service, optional supplements will keep your 1984 CALLBOOKS up to date throughout the year. Published March 1, June 1, and September 1, each supplement contains all activity for the preceding 3 months. Thousands of new licenses, call changes, and address changes are listed in each issue.

The 1984 CALLBOOKS are loaded with extra features for rag-chewers and DX'ers alike. Order your copies now. See your dealer or order directly from the publisher.

COMPARE!
YOU CAN'T BEAT CALLBOOK VALUE!

comply with the directive, the FCC may decide to close its Laurel, Maryland, test lab. If this happens, will the FCC then contract out its work to an independent laboratory? And if it does, will total impartiality be guaranteed? With the compliance-auditing arm of the FCC eliminated, will manufacturers disregard the new FCC rulings and eliminate metallized plastic cases and power line filters in an effort to produce their products more cheaply?

shielding enclosures

In the absence of effective government regulation, what can Amateurs do on their own?

Surprisingly, the most cost-effective way to solve the electronic pollution problem isn’t careful circuit design, but rather the use of well-shielded enclosures. While there are many ways to accomplish this (see table 1), all are essentially the same in that they are variations of treating enclosures. (The emissions previously referred to are naturally radiated emissions; conducted emissions are covered later, but suffice it to say for now that conducted emissions are best prevented by adequate filtering of power lines and other lines or cables leaving or entering the “box.”)

Metal enclosures were the first to offer efficient EMI shielding. Today many companies still produce metal enclosures: Compac, for example, offers its RFT series, which includes built-in SMA, TNC, N, and BNC interchangeable RF connectors, (see fig. 3). Other manufacturers such as Vector Electric produce a series of aluminum Multi-Mod enclosures with tightly overlapping sides and end plates for EMI containment (see fig. 4). Like most metal cases, however, these are more expensive than plastic ones and generally offer less decorative, less protective outer finishes than plastic cases.

January 1984
News, music, and political opinions from around the world are accessible from your home. Listen to music or information from the Near East, Western Europe, South America, even Russia, Vietnam and China. Tune into the U.K.'s BBC, and broadcasts from Canada, Israel and Japan, many of which are in English.

Even if you've never used Short Wave before, the ICOM IC-R70 and the Kenwood R-2000 are a snap and yet are full-fledged Commercial-Grade Short Wave Receivers that outperform units costing twice as much. Couple the IC-R70 or the R-2000 with a Dymek DA-100D Wide Range All-Wave Receiving Antenna and the world is literally at your fingertips. This workhorse outdoor antenna mounts anywhere, atop houses, buildings, mobile homes, etc. It operates on either AC or DC and is equipped with dozens of features to maximize performance.

ICOM, Kenwood and Dymek from Harvey at competitive prices ready to take on the world.
fig. 8. Shielding effectiveness vs. frequency-shielding effectiveness is proportional to the resistivity of thin film coatings, and increases with frequency.

fig. 9. Hole size vs. radiated emissions frequency. Additional shielding materials are not required in a commercial enclosure if hole size is less than 1/20 wavelength, or 1/50 wavelength for military enclosures.

Fortunately, plastic cases can be treated to resist EMI as effectively as metal cases. This treatment process takes one or more of four forms: (1) the cases can be lined with a metal-plated or foil wire mesh screen (see fig. 5); (2) the cases can be painted or sprayed with conductive-particle plastic sprays; (3) the cases can be manufactured with conductive fillers impregnated in the plastic itself (see fig. 6); or (4), the cases can undergo a treatment process for the direct deposit of metals (see fig. 7).

The arc spray coating shown in fig. 7 is a particularly interesting method used at Tafa Metalisation. Despite the fact that similar methods of using high temperature oxy-fuel plasma may damage some plastic surfaces, this method is so gentle that when molten zinc is applied to the surface of fresh fruit, the fruit will not be scorched. This seemingly impossible task is accomplished with a metal sprayer that looks very much like a paint sprayer but differs in that two small rods of metal stock are fed to the heat source and melted by an arc welding technique. This is accompanied by cool compressed air blowing fine atomized particles of molten metal onto the surface to be treated. This allows the plastic's surface to remain below 125°F (50°C), despite the fact that zinc itself requires a minimum temperature of 770°F (410°C) to even begin to melt. A 0.003 inch (0.0762

fig. 10A. Gaskets impregnated with conductive materials.

fig. 10B. Rubber grommets containing conductive particles.

fig. 10C. A foam rubber cushion containing conductive particles.
A coating of zinc over a one-square foot surface requires about 3 ounces of zinc at an approximate cost of 19 cents. A 0.002 to 0.005-inch (0.0508 - 0.127 mm) thick coating of zinc affords a resistivity sufficient for 50 to 90 dB of attenuation to radiation in the sub 100 MHz to 10 GHz range. This is important because EMI problems are essentially broadband in nature, so that shielding methods are devised for effectiveness against the highest potential frequency.

This arc spray coating is classified as either thin film (under 2.5 microns) or thick film (above 2.5 microns in thickness). Thin film coatings work particularly well at higher frequencies (see fig. 8) and provide shielding as a function of their resistivity. These resistive thin film coatings contain minute particles of silver, nickel, or carbon. Surface conductivity is therefore "adjustable" according to the type of spray selected, with mixtures using from 20 to 80 percent conductive materials to provide high conductivity. This is much more than commercial applications require (60 dB at 100 MHz). These coatings are quite fragile, though, and require an additional thin dielectric coating to avoid scratching or "finger-printing" the freshly sprayed plastic surfaces. A scratch can be the "crack" in the box that permits EMI to escape.

**Specialized EMI Problems**

So far we have discussed the containment of EMI using various techniques, but have perhaps labored under the inaccurate assumption that any tight box will contain EMI. Generally, a tight box will contain EMI, but most pieces of equipment must have openings. These take the form of holes in the front panel through which the control shafts (potentiometers, variable tuning capacitors, and such) protrude. Additionally, LED or LCD displays or even a CRT often prove to be troublesome with their even bigger openings; larger pieces of equipment may have blowers, fans, vents, and louvers open to the outside environment. The cases themselves also often have discontinuities in seams or joints. Covers, gaskets, access ports, display windows, shaft holes, cables, and connectors all make it difficult to achieve optimum EMI/RFI integrity.

There is a relationship between their diameter and the frequency of radiated emissions (see fig. 9). The gaskets and rubber grommets that fit around these holes make the gap between the control shaft and the outside world much tighter (see fig. 10). In addition, these grommets are also often treated with conductive materials such as nickel, cobalt, iron, silver, or graphite. Many gaskets are made of wire mesh or conductive elastomers (supple, rubberlike plastic sheets — see fig. 11). Less supple metallic gaskets are therefore limited to straight-edge runs or openings with large radii. Table 2 lists companies and products offered in this general area of EMI shielding. There are mechanical fittings made of wire mesh combined with silicone rubber or neoprene for cores that are both water- and gas-tight. There are also metallic tapes made with sticky or adhesive backs that can be applied to seams in an enclosure from which EMI might radiate. Glass that is relatively clear but has nonetheless been impregnated with conductive EMI constraining particles, (fig. 12), would be ideal in any application using a CRT.

In State Wats 1-800-654-1319 • Out of State Wats 1-800-654-0795
last-minute forecast

Midwinter DX conditions are expected to be very good this first month of 1984. The higher frequency bands (10-30 meters) are expected to provide long skip and transequatorial openings on the 7th and possibly on the 20th. The lower bands (30-160 meters) are expected to provide excellent conditions throughout the month, with short skip during the daytime, between the above dates, and longer skip openings at night when the geomagnetic field is quiet. Geomagnetic ionospheric disturbance can be expected about the 1st, 10th, 18th, and 27th; the 5th, 13th, and 23rd are also possible disturbance dates, though with somewhat lower probability.

For EME and meteor burst communicators, the lunar perigee is on the 19th and a full moon appears on the 18th.

updating the foF2 formula

In the September, 1983, DX Forecaster, formulas were given for determining a mid-latitude local-noon foF2 (F2 layer critical frequency) from solar radio flux or sunspot numbers. The foF2 is the most variable of the propagation parameters that help define the maximum usable frequency (MUF) for a path between you and the DX QTH (MUF ≈ 2.5 foF2). Keep in mind that the MUF is about the optimum frequency for working that DX. These formulas are meant to be used for predicting “long term” (base) values of foF2 (for a few weeks or a month).

Changes in foF2 correlate with the daily solar flux changes over the previous three days. Delay in correlation (onset of foF2 change) depends on the magnitude of the flux change. Consequently these daily flux values can be used to update or “fine tune” the “long term” foF2 values discussed before. Furthermore, the rate of change of foF2 is only 30 percent the rate of change in solar flux and is used to alter the “long term (base) value.”

but what about today?

To determine today’s foF2, use your recorded values of the flux over the previous few days, noting how much it has varied. This variation, when multiplied by 0.3, equals the incremental increase (or decrease) in the long term value or base value of foF2. If you want a forecast of the foF2 that may be expected to occur several days ahead, use the last days’ flux change. Small flux changes (up to 5 or 10 units) do not cause the ionosphere to change very much, so do not work too far back in time. The cause of the delay is that the electrons take to drift or diffuse upward into the F2 region after being produced below 180 km by the solar flux (ultraviolet).

The flux — foF2 correlation is quite good in winter and equinoxal months. For lower latitudes the correlation is even better; for higher latitudes and summer months, correlation is poorer. The solar flux correlation with lowest usable frequency or absorption of the signal (signal strength) is immediate, with no delay experienced. Remember this correlation when using the lower frequencies in or near nighttime.

band-by-band summary

Ten meters will occasionally be open, providing F2 long skip by the transequatorial one-hop propagation mode (TEM). The openings will follow the sun during the day and into the late evening. Geomagnetic disturbances will enhance this mode, as will high solar flux. Openings may favor southern Africa, South America, and Australia.

Fifteen meters can experience the same TEM modes as 10 meters with the openings being more frequent. World-wide DX is prevalent from after sunrise until well after sunset during the periods of high solar flux (listen to WWV at 18 minutes after the hour for reports on solar and geomagnetic conditions).

Twenty and thirty meters will be open most days and into the night to some areas of the globe with 1000-2500 mile long skip and some short-skip of 1200 miles near midday. Both propagation modes follow the sun across the sky; east, south, then west.

Thirty and forty meters are the transition bands, providing all-night propagation as well as some short-skip conditions during the daytime. Most areas of the world can be worked from darkness hours till just before sunrise. Hops shorten on these bands to about 2000 miles, but the number of hops can increase since signal absorption is low during the night.

Eighty meters offers ample opportunity for much DX work. Several stations have worked over 300 countries on this band. The band operates much like 40 meters except that the hop distances shorten to about 1500 miles. Noise from distant thunderstorms is low enough to make these bands a joy to work this time of year. The path direction follows darkness across the earth (east, south, then west).

One-sixty meters, similar to 80 meters, will provide multihop opportunities, though each hop shortens to 1000 miles.

ham radio
The italicized numbers signify the bands to try during the transition and early morning hours, while the standard type provides the MUF during 'normal' hours.

*Look at next higher band for possible openings.

84 January 1984
short circuit

optical FM receiver

In the article by Poon and Pieper, "Construct an Optical FM Receiver," on page 53 of the November, 1983, issue, error was inadvertently introduced in editing. The text should read as follows:

"The deflection angle $\phi_d$ (measured outside the cell) between the incident beam of light and the first order light (beam) equals

$$\lambda_0/\Delta = \lambda_0 f/V_s$$

where $f$ is the frequency and $V_s$ is the velocity of sound.

Incident light is most efficiently diffracted when the incident angle equals

$$\lambda_0/2\Delta,$$

where $\Delta$ refers to the center of the band."

**TELEX COMMUNICATIONS, INC.**

the 2-meter V-antenna

I am always on the lookout for new antennas for HF and VHF applications because they represent projects that can be assembled on a weekend at minimum cost, with maximum enjoyment. Recently, the V antenna came to my attention as a possible 2-meter portable radiator.

The V antenna (see fig. 1) consists of two long wires spreading apart from one end in an angle of less than 90 degrees at the apex (known as the apex angle). The maximum direction of radiation bisects the angle, requiring careful placement for best results. The leg length determines the overall gain and directivity of the system as well as the apex angle. I chose a leg length of 2.25 wavelengths and a 65-degree apex angle resulting in a 15-foot long wire antenna for 2 meters. (Charts are available if you wish to use a different leg length.)

To determine the length in feet for a frequency of 146.9 MHz, I used the following expression:

\[
L = 984 \frac{(N - 0.025)}{F}
\]

where
- \(L\) = length in feet
- \(N\) = number of wavelengths
- \(F\) = frequency (MHz)

Solving for:

\[
L = 984(2.25 - 0.025)/146.9
\]

\[
L = 14.9 \text{ feet} = 14 \text{ feet } 11 \text{ inches}
\]

construction

I used No. 22 gauge stranded insulated hookup wire for the antenna for several reasons. The wire is very flexible and does not end up in a tangle during storage. More importantly, the wire is available at any electronic supply store and is not expensive.

By Thomas M. Hart, AD1B, 32 Westwood Terrace, Westwood, Massachusetts 02026

A recent article by Bill Orr discussed the problem of feeding V antennas. I found his solution quite satisfactory for 2 meters. A 50-ohm coax line services the system, matched by a 1/4-wavelength section of 75-ohm coax.

The length can be found using the following:

\[
L = \frac{246(V)}{F}
\]

where
- \(V\) = velocity factor
- \(F\) = frequency (MHz)
- \(L\) = length (feet)

\[
L = \frac{246(0.66)}{146.9}
\]

\[
L = 1 \text{ foot } 1 \text{ inch for RG-59 (73 ohm)}
\]

The Orr article recommends forming the matching section into four loops to “decouple the outside of the line from the antenna currents.”

The completed antenna, run as a horizontal V, loaded well (SWR 1.1:1) and enabled me to easily access the desired repeaters. So, if you are interested in a different solution to the perennial antenna problem, try this conversation piece. In terms of efficiency, the reference texts indicate that a V with 2.25 wavelength legs has a theoretical gain of 4.5 dB over a halfwave dipole. The V antenna will provide a substantially better signal than the usual 1/4-wave coat-hanger vertical.

### ASTRON POWER SUPPLIES

#### RS and VS SERIES

**SPECIAL FEATURES**
- SOLID STATE ELECTRONICALLY REGULATED
- FOLD-BACK CURRENT LIMITING protects Power Supply from excessive current & continuous shorted output.
- CROWBAR OVER VOLTAGE PROTECTION on all Models except RS-4A.
- MAINTAIN REGULATION & LOW RIPPLE at low line input Voltage.
- HEAVY DUTY HEAT SINK • CHASSIS MOUNT FUSE
- THREE CONDUCTOR POWER CORD
- ONE YEAR WARRANTY • MADE IN U.S.A.

#### PERFORMANCE SPECIFICATIONS
- INPUT VOLTAGE: 105 - 125 VAC
- OUTPUT VOLTAGE: 13.8 VDC ± 0.05 volts (Internally Adjustable: 11-15 VDC)
- RIPPLE: Less than 5mv peak to peak (full load & low line)

NEW FROM RAMSEY 20 MHz DUAL TRACE OSCILLOSCOPE

Unsurpassed quality at an unbeatable price, the Ramsey oscilloscope compares to others costing hundreds more. Features include a component testing circuit that will allow you to easily test resistors, capacitors, digital circuits and diodes • TV video sync filter • wide bandwidth & high sensitivity • internal graticule • high quality rectangular CRT • front panel trace rotor • Z axis • high sensitivity x-y mode • very low power consumption • regulated power supply • built-in calibrator • rock solid triggering • high quality hook-on probes

$399.95 high quality hook-on probes included

RAMSEY D-1100 VOM-MULTITESTER
Compact and reliable, designed to service a wide variety of equipment. Features include • mirror back scale • dual-jawed precision moving coil • double overload protection • an ideal low cost unit for the beginner or as a spare back-up unit.

$199.95 test leads and battery included

RAMSEY D-2100 DIGITAL MULTITESTER
A compact easy to use unit designed to operate like a pro. Features • 3 1/2 digit LCD • low BAT indicator • all range overload protection • overrange indication • auto-zero • patent pending • dual scale integration • vinyl carry case

$549.95 high test leads, battery & vinyl carrying case included

RAMSEY D-3100 DIGITAL MULTITESTER
Reliable, accurate digital measurements at an amazingly low cost • in-line color coded push buttons, speeds range selection • abt plastic tilt stand • recessed input jacks • overload protection on all ranges • 3 1/2 digit LCD display with auto zero, auto polarity & low BAT indicator

$59.95 test leads and battery included

CT-70 7 DIGIT 525 MHZ COUNTER
Lab quality at a breakthrough price. Features include • 3 frequency ranges each with preamp • dual selectable gate times • 1 ppm accuracy indicator • 50mV ± 150 MHz typical sensitivity • 9 digit display • 0.1 ppm accuracy

$119.95 wired includes AC adapter
CT-70 kit .................................. $99.95
BP-4 nicad pack .......................... 8.95

CT-90 9 DIGIT 600 MHZ COUNTER
The most versatile for less than $200. Features include • 3 selectable gate times • 9 digits • gate indicator • display hold • 25mV ± 150 MHz typical sensitivity • 10 MHz timebase for WWV calibration • 1 ppm accuracy

$149.95 wired includes AC adapter
CT-90 kit .................................. $129.95
OV-1 0.1 ppm Oven Time base .... 59.95
BP-4 nicad pack .......................... 8.95

CT-125 9 DIGIT 1.2 GHz COUNTER
A 9 digit counter that will outperform units costing hundreds more. • gate indicator • 25mV ± 150 MHz typical sensitivity • 9 digit display • 1 ppm accuracy • display hold • dual inputs with presets

$169.95 wired includes AC adapter
CT-125 kit .................................. $149.95
BP-4 nicad pack .......................... 8.95

DM-700 DIGITAL MULTITESTER
Professional quality at a hobbyist price. Features include 26 different ranges and 5 functions • 3 1/2 digit • 4 digit LED display • automatic decimal placement • automatic polarity

$119.95 wired includes AC adapter
DM-700 kit .................................. $99.95
MP-1 probe set ............................ 4.95

PS-2 AUDIO MULTIPLIER
The PS-2 is handy for high resolution audio resolution measurements, multiplies UP in frequency • great for Pri tone measurements • multiplies by 10 or 100 • 0.01 Hz resolution & built-in signal preamplifier/conditioner

$499.95 wired includes AC adapter
PS-2 kit ...................................... $39.95

PR-2 COUNTER PREAMP
The PR-2 is ideal for measuring weak signals from 10 to 1,000 MHz • 25 mV gain • BNC connectors • great for sniffing RF • ideal receiver/TV preamp

$449.95 wired includes AC adapter
PR-2 kit ...................................... $34.95

PS-1B 600 MHZ PRESCALER
Extends the range of your present counter to 600 MHz • 2 stage preamp • divide by 10 circuitry • sensitivity 25mV @ 150 MHz • BNC connectors • drives any counter

$59.95 wired includes AC adapter
PS-1B kit .................................... $49.95

ACCESSORIES FOR RAMSEY COUNTERS
Telescopic whip antenna — BNC plug ........... $8.95
High impedance probe, light loading ....... 19.95
Low pass probe, audio use .................. 16.95
Direct probe, general purpose use ........... 13.95
Tilt ball, for CT-70, 90, 125 ................. 3.95

three circuits for repeaters

Unmanned repeater operation requires the use of remote control circuits. Figs. 1, 2, and 3 illustrate three popular circuits that enhance repeater operation: the autopatch phone line interface, the phone auto answer and ring indicator, and the TouchTone™ sequence decoder. All three are constructed of easy-to-find components.

autopatch phone line interface

Fig. 1 is a schematic diagram of a repeater-to-phone line interface for use as an autopatch. Its function is to provide for the receiver-to-phone line and phone line-to-transmitter link, with both using an opamp for gain. Q1 and Q2 control which audio path is active; when the receiver squelch sense line goes above 1 volt, Q1 conducts. This enables the receiver audio to pass the phone line. At the same time, Q2 turns off and the phone-to-transmitter audio is disabled. The receiver squelch input, therefore, must provide a high (above 1 volt) when an input is present. When the receiver squelch sense input goes below 0.5 volts, Q1 turns off and Q2 conducts, passing phone-to-transmitter audio and disabling the receiver audio path.

R1 adjusts the receiver-to-phone line audio and R2 adjusts the phone-to-transmitter audio level. R3 is an optional adjustment to allow for passing phone audio to a TouchTone™ decoder.

Transformer T1 isolates the electronics from the phone line and thereby maintains a balanced phone line. Relay RL1 acts as the on/off hook interface for the patch. When RL1 is energized, the phone line will be seized and audio can be passed to and from the phone line to the repeater receiver/transmitter. A low on the “line seize” will energize RL1. Make sure that diode CR2 is in place as shown; otherwise damage to the circuit that energizes RL1 could occur when the relay is turned off.

Diode CR3 and the 100k resistor force the audio circuits to pass receiver-to-phone line audio and disable the phone-to-transmitter audio when the autopatch is not in use. This prevents any audio which might be produced from the autopatch circuit from going to the repeater transmitter. Several different types of op amps can be used. In this case, LF353 is used. In choosing a different op amp, the primary consideration should be one of stability.

This circuit has been used by many repeater groups with much success. Problems which might be encountered are primarily with dialing phone numbers. This autopatch circuit will provide for a very flat audio response with low noise and distortion. However, with the typical HT or mobile rig, it is often found that the rolloff characteristics will produce imbalance in the high to low group levels in the TouchTone™ audio. The phone company is becoming more and more

WARNING
SAVE YOUR LIFE OR AN INJURY

Base plates, flat roof mounts, hinged bases, hinged sections, etc., are not intended to support the weight of a single man. Accidents have occurred because individuals assume situations are safe when they are not.

Installation and dismantling of towers is dangerous and temporary guys of sufficient strength and size should be used at all times when individuals are climbing towers during all types of installations or dismantlings. Temporary guys should be used on the first 10' or tower during erection or dismantling. Dismantling can even be more dangerous since the condition of the tower, guys, anchors, and/or roof in many cases is unknown.

The dismantling of some towers should be done with the use of a crane in order to minimize the possibility of member, guy wire, anchor, or base failures. Used towers in many cases are not as inexpensive as you may think if you are injured or killed.

Get professional, experienced help and read your Rohn catalog or other tower manufacturers' catalogs before erecting or dismantling any tower. A consultation with your local, professional tower erector would be very inexpensive insurance.

Paid for by the following:

UNR-Rohn
Division of UNR, Inc.

Prairie, Illinois 61401
USA
sensitive about this and is using company equipment. I assume this is done to provide for a greater degree of falsing prevention of their TouchTone™ decoders. The solution is solved by providing equalization that emphasizes the high response with about a 6 dB per octave rolloff. That is to say, a two-to-one ratio between the 697 Hz tone (lowest low group TouchTone™) and the 1209 Hz tone (lowest high group TouchTone™).

If you need an autopatch — and most repeater users do — this is a good and reliable circuit.

Phone auto answer and ring indicator

Fig. 2 is a schematic diagram of a ring detect circuit for automatic phone answering or tone generation for reverse autopatch use. U1 is an opto-isolator consisting of an LED and phototransistor. When the LED lights, the phototransistor conducts. The diode is connected across the phone line through a 10K resistor and a 0.1 μF capacitor. This combination is transparent to the phone line, which is a must as far as the phone company is concerned. When the phone starts ringing, the ring signal produces pulses which force U1 to conduct and generate pulses in turn. This output is coupled to U2 and the pulses are counted. When the count reaches 8, U2's output goes to a logic high and forces Q1 to conduct closing the line seize relay, RL1.

The output of U1 is also coupled to U3 which is a 555 timer IC operating in the oscillator mode. When pin 4 goes high the oscillator will produce a tone at a frequency determined by R1. R2 is the level adjustment for this tone. This tone can be used to signal a repeater listener when the phone is ringing for use in a reverse autopatch. In the reverse patch mode, jumper J1 should not be connected in order to prevent U2 from answering the phone, stopping the ringing of the phone.

Jumper J1 determines whether the phone is answered automatically and J2 forces the tone generator to produce a tone on each ring of the phone. If capacitor C1 is not used, the output pulses from U1 will be at the phone ring rate (20 or 30 Hz depending on the phone system). This will force the phone to be answered.
almost immediately and the tone generator to give a warbling tone. However, if C1 is inserted, a single pulse will be given for each ring. Thus, the phone will be answered on the eighth ring and the tone generated will be constant while the ring is taking place.

The "clear" input to U2 clears the ring counter when a logic high is present on this line. This input should be connected to the decoder logic, enabling a caller or repeater user to force the disconnect of the phone when desired.

**TouchTone™ sequence decoder**

Fig. 3 is a schematic diagram of a TouchTone™ sequence decoder circuit. Its purpose is to take active low inputs from a TouchTone™ decoder and react to a proper sequence of digits. The proper sequence is determined by which TouchTone™ digits the user connects to the sequence decoder inputs TT1, TT2, TT3, and TT4. The function of this circuit is most useful for repeater builders that require some sort of logic control such as enabling and disabling functions on the repeater.

The circuit operates on the principle of requiring the digits to arrive in a proper sequence, preventing a function from being activated should a random sequence be entered. For example, if TT1 = TouchTone™ digit 1, TT2 = digit 2, TT3 = digit 3 and TT4 = digit 4, then the code for forcing the output to a logic high is 123. To force the output low the code is 124. If the sequence is dialed in any order, the sequence decoder will not react to it (for example, dialing 213 will do nothing).

U1 is a "one-shot" circuit that reacts to a pulse from the TT1 input by forcing its Q output, pin 13, to a high for a time determined by R1 and C1. Larger values keep high longer. Using the given values Q remains high for 4 seconds. If TT1 is strobed again during this period the 4-second period will restart. However, if TT1 is not strobed again, Q will revert back to a logic low. When the Q output is in the low state, no sequence decoding can take place. U1 acts as both a timer and a first digit seeker. After the first digit is dialed the remaining digits of the code must be dialed within 4 seconds. U2A decodes the second digit of the sequence. Upon dialing the second digit, the Q (not Q) goes low, enabling the TT3 and TT4 inputs of U3. If TT3 is dialed next, pin 3 of U3 will go low, producing a latched output on U2B's Q output, pin 9. If TT4 is dialed as the third digit, the Q output will be forced low.

Pin 9 of U2B is a latched output and will remain in its state as long as power is maintained or until the proper sequence is dialed forcing Q to another state. Of course if an "ON" code is dialed and the state of the decoder is ON, no change will take place.

C2 and R2 force the Q output of U2B to a low on power up. This feature is most desirable in cases where power may be lost and no one is around to reset the circuit to the desired state, which is the case in most unmanned repeater sites. However, if the desired output state is a high on power up, the user should use the Q output. In this case the ON/OFF codes are reversed from the above description.

As shown, the ON/OFF codes are three digits each. However, if only a two-digit code is desired, removing the A part of U2 and connecting U1's Q pin 4 output to pins 1 and 4 of U3 will produce a two-digit decoder with the ON code being TT1 and TT3.

The OFF code becomes TT1 and TT4. If more than three digit codes are desired, all one must do is add D-type flip-flops after U2A and before U3 connecting U2As Q (not Q) to the added flip-flops D input and its Q output to U3. For each added flip-flop the code is increased by one digit.

The suggested digits for setting up the codes is determined primarily by how the decoder is to be used. In the case where TouchTone™ might be used for other functions such as dialing numbers on an autopatch, it is most desirable to make sure that a telephone number will not produce the same sequence of digits as a controlling code. Thus, if a controlling code were 123 and a phone number of 844-1235 is dialed, the sequence decoder would react. This can be prevented by making sure that at least one of the digits in a code is not a 0 through 9. Thus, one should use a # or a *, or A, B, or D, if 16 digit TouchTone™ pads are desired, for at least one digit of a code.

Ron Wright, N9EE

SELF STANDING COMPUTER TERMINALS

We acquired a small number of these beautifully made computer terminals which were made by a major U. S. computer manufacturer. We do not know all the details about them at press time but we can tell you that these terminals cost someone at least $2,000.00 each. They lose, you win! The terminals feature the following: 3 separate microprocessors for powerful capabilities, 106 key ASCII keyboard for changing the parameters of the installed EAROMs, 16K RAM, 48K ROM, serial RS-232 asynchronous data communications (synchronous optional), selectable baud rates of 75-38.4K BPS, high resolution, 12" green screen, composite video monitor, 80 x 25 line display with expandable character font (40 x 25), scrolling display, built in reverse video option, light weight, self contained, tightly regulated, switching power supply and much more than can be fit in this space. The terminals can configured in daisy chain format around a central host computer. All units are new or are in like new condition & are checked for completeness prior to shipping. The terminals are sold untested. Each one comes with operator's manual. UPS shpg. wt. 55 lb. Stock no. MT-686 $289.00

We offer the following as options: schematic pac. 3 lb. $10.00 USRT for synchronous data comm. w/ installation data $10.00 25' RS232 cable 1 male & 1 female DB25 connector $20.00 For further info, send $3.00 for a brochure on this terminal which is applicable to your order for and MT 686.

U. S. RECEIVER TRANSMITTER RT 176/PRC 10 RADIOS

Thru a very lucky purchase, we just got a small quantity of new, unused PRC 10 radios. They are just beautiful. Any collector would be proud to have one of these babies in his possession. These radios came bulk packed to us just the way they were shipped from the factory to Uncle Sam. They were never released into the field. We are selling these as complete sets. The picture below shows all accessories that will be shipped with each unit.

RT 176/PRC 10 feature: voice communication, tuneable range of 38-55 MC, super heterodyne FM front end, 9 watt xmt., range of 5 miles (may vary depending on antenna used & sitting conditions), & total wt. w/ accessories of only 16 lb. Each set will include at no extra cost operators manual, schematic, & 4300 KHz. calibration xtal. They do not come w/ batteries, but they are available commercially. We are selling these as complete sets as shown below for $100.00 / set. Shpg. wt. 18 lb. The quantity is limited, so act fast.

PDR-27 NAVY RADIATION METER

Just released by the US Navy. They appear to be in excellent condition and include the fitted aluminum transit case. Batteries not furnished but are available in most electronic supply houses. 4 ranges 0.5 to 500 m/hr. Removeable hand probe, detection of Beta and Gamma radiation. With today's world conditions and perhaps proximity to a nuclear power station, it might provide a little insurance to own one of these instruments. With no facilities to check or test, we offer AS IS, visually OK Schematic provided with each. We have some accessories and offer as an option although not required for operation. Shipping wt. 22 lb. PDR-27 Rad Meter $50.00

PDR-27 phones $7.00 Approx. 100 page Instr. Book $10.00 Hi Sensitivity GM tube $10.00 Low Sensitivity GM tube $5.00
The above listed tubes are already installed in the meter. We are offering these as spares if desired.

PHONE ORDERS accepted on MC, VISA, or AMEX No COD's. Shpg. extra on above.
Send for free 72 page catalogue jam packed w/ bargains.
ANNUAL LAS VEGAS PRESTIGE CONVENTION

HACIENDA RESORT HOTEL
Las Vegas, Nevada

JANUARY 12-13-14-15, 1984

Cocktail Party hosted by hamradio MAGAZINE Friday evening for all SAROC exhibitors and SAROC Advance or Regular paid registered guests. Ladies' Program on Saturday included with SAROC Advance or Regular paid registration at no additional charge for ladies who register. Two HACIENDA RESORT HOTEL Breakfasts or Brunches in the Sunburst room are included with each Advance or Regular paid registration; one on Saturday and one on Sunday. Technical sessions, EXHIBITS, and SWAP TABLES open on Friday and Saturday to all SAROC paid registered guests. One SWAP TABLE available free to SAROC non-commercial guests holding Advance or Regular paid registration. SAROC is hosted by Southern Nevada Amateur Radio Club. SAROC Advance registration is only $17.00 per person, if postmarked before January 1, 1984. After January 1, 1984, SAROC Regular registration is only $19.00 per person. SAROC fee of $2.00 per person for those who want to attend only SAROC technical sessions, visit EXHIBIT and SWAP TABLE area. No admission to any function without a SAROC paid registration and wearing the SAROC registration badge in plain view. SAROC coupon book and cellophane badge holder may be picked up at SAROC registration desk. Send check or money order to SAROC, P.O. Box 945, Boulder City, NV 89005-0945. Refunds will be made after SAROC is over to those requesting same in writing and postmarked before January 12, 1984. Special SAROC HACIENDA RESORT HOTEL room rate is $35.00 (plus .50 for telephone and room tax), per night, single or double occupancy. HACIENDA RESORT HOTEL accommodations request via mail to HACIENDA RESORT HOTEL, P.O. Box 15566, Las Vegas, NV 89114 or call toll free 1 (800) 634-6713. Either way they request a FIRST NIGHT'S DEPOSIT TO BE ASSURED A RESERVATION. SAROC 1985 scheduled Jan. 10-13.

Clip and mail ASAP to SAROC, P.O. Box 945, Boulder City, NV 89005-0945.

Enclosed is $________ check or money order (no cash) for SAROC Advance Registration(s) @ $17.00 each: after Jan. 1, 1984 SAROC Regular Registration is $19.00 each.

BASIC PROGRAM MANUAL FOR AMATEURS

Programs on quads, beams, traps, dipoles, antennas with load, filters, pads, strip lines, op amps, microwave, RF coils, Ohms law, L, C, power, global distances and much more.

All FOR $9.95

ATTENTION YAESU FT-207R OWNERS

AUTOMATIC SCAN MODULE

15 minutes to install; scan restarts when carrier drops off; busy switch controls automatic scan on-off; includes module and instructions.

Model AS-1 $25.00

BATTERY SAVER KIT

Model BS-1 $14.95

- No more dead batteries due to memory backup
- 30% less power drain when squelched
- Simple to install, step-by-step instructions and parts included
- 4 mA memory backup reduced to 500 µA
- 45 mA receiver drain reduced to 30 mA
- Improved audio fidelity and loudness

When you purchase your tower from Tri-Ex, you can be assured that all welds have been done by certified welders, all construction and galvanizing has met ASTM standards, all towers have been constructed in precision jigs, all steel has been tested for carbon content and tensile strength.

When it goes to shipping, John is ready.

When you decide on Tri-Ex you have many models to choose from.

STACKED:

Light, medium, heavy duty 10 feet and up.

CRANK UPS:

Light, medium, heavy duty 25 feet to 88 feet standard.

SPECIAL TOWERS:

Sky needle, Clementower 37 feet to 180 feet & higher

Introducing Tri-Ex's new DX-86 — 86 feet tall, 25 square feet in a 50 mph wind.

Call your local dealer for details.

**Coming Events**

**ACTIVITIES**

"Places to go..."

**South Bend, INDIANA:** Hamfest Swap & Shop, January 6th, Sunday 11 AM to 4 PM. Sponsored by the St. Joseph Radio Club and hosted at U.S. 33 Overney North between St. Joseph Bank and river. Historical museum and same building. Carpeted hall across street. Tables $3 each, $6 for 2 or $10 for 6. No tickets, $5 at door. Open 9AM to 4PM. Talk on 146.95 or write to Bob V. 77783, Homer, IN 46640.

**MIAMISBURG, OHIO:** Craft show. Market Street Park, 10AM to 3PM. Sponsored by the Miami Valley Amateur Radio Club. Tickets $1 at door. Tables $3 each, $6 for 2 or $10 for 5. Talk on 146.95 or write to Keith K. 4319, Miamiass, OH 45342.

**New York, NEW YORK:** Yonkers Electronics Auction sponsored by the Yonkers ARC, Sunday, April 1st, 10 AM to 1 PM. Lemple Hall 556 Yonkers Avenue, Admission $3, No Exceptions. Young children under free. Auction starts 10 AM. New and used equipment. Cub Scout sponsored, cash only. Talk on 146.95 or write to Mike K. 77783, Homer, IN 46640.

**Ohio:** Mansfield Mid Winter Hamfest/Auction, Sunday, February 9th, 10 AM to 2 PM. Lemple Hall 556 Yonkers Avenue, Admission $3, 6$. Each underfree. Auction starts 10 AM. New and used equipment. Cub Scout sponsored, cash only. Talk on 146.95 or write to Mike K. 77783, Homer, IN 46640.

**Cincinnati, OHIO:** ARRL 84 System Convention and Flea Market February 25th and 26th. Registration $5. Flea market $4 per space both days. Forums, meetings, vendors, Wouff Horn, banquet. Drive all day Sunday. Talk on 146.95 or write to Larry C. 77783, Homer, IN 46640.

**Virginia:** Frostfest '84, Winter Amateur Radio and Comput Shop, Sunday, January 15th, 10 AM to 5 PM. Richmond, VA 23226. Talk on 146.95 or write to Larry C. 77783, Homer, IN 46640.

**Other Events:**

**Flea Market**

**RATES** Noncommercial ads 10¢ per word; commercial ads 60¢ per word both payable in advance. No cash discounts or agency commissions allowed.

**HAMFESTS** Sponsored by non-profit organizations receive one free Flea Market ad (subject to availability) on a space-available basis only. Repeat insertions of hamfest ads pay the non-commercial rate.

**COPY** No special layout or arrangements available. Material should be typewritten or clearly printed (not all capitals) and must include full name and address. We reserve the right to reject unsuitable copy. Ham Radio cannot check each advertiser and thus cannot be held responsible for claims made. Liability for correctness of material limited to corrected ad in next available issue.

**DEADLINE** 15th of second preceding month.

**SEND MATERIAL TO:** Flea Market, Ham Radio, Greenville, N.Y. 12084.
THE SATELLITE EXPERIMENTER'S HANDBOOK

Now, under one cover, here is all you need to communicate through or pick up the signals from orbiting satellites. Whether your interests is in Amateur Radio, weather or TV-broadcast spacecraft, you'll find what you're looking for in The Satellite Experimenter's Handbook.

Since the first OSCAR ( Orbiting Satellite Carrying Amateur Radio) was launched in 1961, thousands of ham radio operators, scientists, educators and satellite enthusiasts from around the world have used these "birds" for pleasure, education and experimentation. You can join them! And if you're already into satellite communications, you'll find a wealth of practical information on all aspects of the spacecraft—from satellite design to ground-station equipment and antennas.

Whether you're a beginner, an experienced satellite enthusiast, a teacher or a scientist, you'll find The Satellite Experimenter's Handbook to be indispensable. $10 U.S., $11 in Canada and Elsewhere. Copies available soon. ARRL, 225 Main St., Newtonville, CT 06111.

ORDER TODAY!
Clean up the radio/computer clutter.

For less than $250 you can make your investment in yourself pay off!

Chances are you have spent a couple thousand dollars on setting up a computer system that gets a lot of your work done. But sometimes it gets to be work to work at it.

I known that when I have to move two program manuals and a pencil holder to boot up the disk drive, it is work. When there is an unlabeled floppy (that I am going to identify some day) on top of the monitor and the business checkbook is on top of the printer... and I will remember (I hope) before the next “report” comes through... that is work.

I found the annoyance of my own “computer clutter” was even worse than the extra work the disorder created. And that is when I started looking for some practical furniture for my computer setup. Since I had already spent a lot of money on the system itself, I was really dismayed when I found out how much it would cost to get a decent-looking desk or even a data table if you do not yet have a microcomputer of the system itself, I was really dismayed when I started paying money on setting up a computer clutter, and I will bet a lot of your time and energy.

In fact, it was junk! And it took a long time for me to find something that was really worth the money... and more.

A lot of my working day is spent with my computer, and I will bet a lot of your time is too. So I figure a “home” for my system—a housing that is good looking as well as efficient to work at—will pay off two ways:

1. Less work: an efficient and orderly layout will save me time and energy.
2. Personal satisfaction: good quality furnishings look better; they just plain feel better to work at too.

So imagine how good I felt to find the “Micro-Office” Work Center! These are fine pieces of computer system furniture that make my office-at-home as pleasant a place to work as it ought to be. And the biggest and best surprise is the low, low price for such good quality.

Here is what you get—all for only $249.50 plus shipping:

- Mar-resistant work surface. Your choice of oak or walnut grained. Work surface height is adjustable to your keyboard, your chair, your height.
- Two shelves plus work surface extender. Both shelves tilt to lock in position so that monitor faces you—in a position that does away with glare and neck craning forever. Retainer bar keeps equipment from sliding off shelf. Snap-in bookends hold reference manuals and programs.
- Strong, sturdy and steady. All-steel welded frame construction is concealed by top-quality wood grain surfaces with finished trim. Adjustable floor levelers included. The work center is really a piece of fine furniture.
- There is no risk in buying from us either. We will make a full refund of purchase price plus shipping charges if you return the workcenter within 30 days for any reason whatsoever. In addition, the product is warranted for any defects in material or construction for a full year from date of purchase. This is a no-risk investment in your own productivity and work efficiency that will pay off for years to come—even if you do not yet have a microcomputer of your own.
- Take your choice for your own work center decor:

Order 48-inch unit in walnut, #2KPO-945, or in oak, #2KPO-947. Only $249.50 for each unit plus $20.00 shipping charge. On orders for two or more units at the same time, shipping charge applies to only the first unit ordered. shipments made UPS, so we cannot ship to post office box. Illinois residents please add $15 per unit sales tax. Please allow 10 extra days out for any defects in material or construction for a full year from date of purchase. This is a no-risk investment in your own productivity and work efficiency that will pay off for years to come—even if you do not yet have a microcomputer of your own.

- Take your choice for your own work center decor:

was born the ASTI project. The answers on TVRO works, starting with the uplink, transmission and provides a brief summary of the rest and describes potential TI sources by function and frequency. Chapter 5 deals in the symptoms of TI. Plenty of photos are provided so the reader can relate his unknown problem to known and quantified problems. Chapters 6 through 11 deal with the actual site selection, antenna/LNA and other components in the system. Complete coverage is given to ensuring that the system is engineered properly, the first time through, to reduce TI problems to an absolute minimum. Some of the methods of TI suppression discussed are a bit severe, such as pits, fences, and other forms of artificial microwave barriers. However, some are absolutely necessary to eliminate the really thorny TI problems. The authors have gone to a great deal of trouble to discuss and eliminate some misconceptions that exist about TI shielding. In some cases, microwave shields are more expensive than they should be because of a lack of solid technical information. The authors give a complete description of the optical principles that control microwave radiation. And upon this framework, how innovative solutions can be derived to solve TVRO problems. Chapters 12 and 13 deal with how to eliminate unavoidable TI; Chapter 12 discusses what filters are available, their ability to counter TI, and their application at critical points in the system. Chapter 13 deals with “worst case” situations and takes full advantage of the authors’ practical field experience in TI reduction.

Finally, chapter 14 deals with SMATV techniques for satellite and master TV systems. Techniques are outlined for avoiding and suppressing the interference that often comes from this kind of system hybridization.

This book is an absolute must for the professional TVRO and satellite earth station community. I would also recommend ASTI to home TVRO owners as an invaluable resource book. Even for those who do not now have a TI problem, construction of TI-producing systems continues daily. A trouble-free system today could become an unusable system tomorrow. The retail price for ASTI, $125.00, may sound a bit high but is quite reasonable in light of the wealth of information found within the book. (Besides, when you’ve spent more than $4,000 to install a TVRO system, the price of ASTI seems inexpensive, compared to a microwave technician’s time in troubleshooting a TI-plagued system. MFC also provides an ASTI update service for $60/year that will keep you fully informed on all the latest TI problems and solutions.

For more information on ASTI, contact MFC at 6743 Kinne Street, East Syracuse, New York 13057.

Keithley Model 130-A digital multimeter

The latest addition to Keithley’s product line, the Model 130-A Digital Multimeter, reached my desk the other day for review. I have been looking over quite a few multimeters over the last several months for ham radio and I must admit that upon opening the box, I found the Model 130-A to be the most aesthetically pleasing that I have seen. Functionwise, color has little to do with performance. Ergonomically, however, a well designed, color-coordinated piece of test equipment will eliminate eye strain and fatigue that can reduce a test technician’s overall performance.

Another interesting ergonomic feature is that the unit is designed to comfortably fit into your hand. Should the need arise to change scales or units to be measured, when the unit is in your left hand, it can be done easily and conveniently with the left thumb. This allows the user to hold the probes in position while the scales are being changed. Keithley also provides a handy carrying case with a belt loop. The small size means that you can stow the Model 130-A into your tool box without displacing too many tools.

The display for the Model 130-A uses an easy-to-read, 3/5 inch VCD readout. The large readout combined with work stand makes the 130-A digital multimeter right at home in your workshop, as well as being an invaluable tool for field service.

Keithley also has a full line of accessories for the Model 130-A that includes a temperature probe that will measure from -55 to 150 degrees C, high voltage probe that is rated up to 40 kV, a 50 ampere shunt, a clamp-on AC current probe, and of particular interest to Radio Amateurs and other RF people an RF voltage probe for measuring voltages from 100 kHz to 250 MHz.

The Model 130-A is rated at a maximum common mode voltage of 500 volts and is de-
A small investment for a high-paying career in eliminating unnecessary cuts and easy to follow study material. Obtaining the General Radio Telephone License can enhance your job potential. It is priced at $145 and comes with battery, test leads, and instructions.

Specifications

- **DC volts**: 200 mV to 1000 V (± 0.25% + 1d)
- **AC volts**: 200 mV to 750 V (± 1% + 3d)
- **Resistance**: 100 Ω to 20 MΩ (± Avg. 275%)
- **DC amps**: 2 mA to 10 A (± Avg. 7.5%)
- **AC amps**: 2 mA to 10 A (± Avg. 7.5%)

This is an excellent product and will be right at home in either your ham shack or on-the-job. For more information, contact Keithley Instruments, 28775 Aurora Road, Cleveland, Ohio 44139.

**Explorer 14**

Explorer 14 is a three-band (10, 15, and 20 meters), four-element (two parasitics), Yagi antenna that provides complete band coverage without retuning. Telex/Hy-Gain, the manufacturer, was able to achieve this performance by incorporating a multi-section driven element and separate reflectors for 10 and 15/20 meters. (The single director uses 15 and 20 meter traps.) It is relatively light (45 pounds, 20.4 kg), can be installed by one person (see installation), does not require any length-spacing readjustments after initial preset and is fed directly by 50-ohm coaxial cable — there's no gamma match to adjust. Its small size (14-foot boom) is an attractive feature for those who must be concerned with neighborhood aesthetics, while mechanically it accounts for only 7.5 square feet of wind surface area. Important specifications include a maximum gain of 8.8, 8.0, and 7.5 dBi for 10, 15, and 20 meters, respectively; a worst-case VSWR of less than 2.0:1 from band edge to band edge; and an average F/B ratio of 16 dB on 10/20 meters and 19 dB on 15 meters. It handles maximum legal power and is at DC ground potential including coaxial inner conductor.

**para-sleeve system**

The driven element consists of three sections: a center element and a closely spaced front and rear sleeve. The para-sleeve system (patent pending), basically an open-sleeve dipole, uses a trapped 15 and 20 meter driven element and two parallel elements for 10 meters. A Hy-Gain balun provides the balanced-to-unbalanced transformation while maintaining DC continuity between the antenna and cable inner and outer conductors.

**construction**

I enjoy assembling kits that are complete, have a well-written and diagrammed manual, and have been engineered for trouble-free assembly. In designing this kit, the staff at Hy-Gain must have carefully thought through each step, anticipated problem areas, and corrected them as needed. Construction is simple; I have to admit that my two children (ages 7 and 9) built most of the antenna — and were usually one step ahead of me. All parts fit as described and were of good quality (stainless steel for the brackets and hardware).

Of course, the usual common-sense techniques are called for. Read through the manual carefully: clear a space in which to work; read the manual; unpack, count, and identify parts; read the manual, and proceed. You might have noticed that I've said "read the manual" three times; Hy-Gain recommends this as a good number. I have personally seen "experts" assemble antennas incorrectly because they "knew" what to do.

At one point in construction I was ready to pick up the phone and call Hy-Gain for two missing aluminum sections until I discovered that the manufacturer conserves packing space by telescoping some sections within others. In one particular case, the ID/DD dimensions were so close as to make the inner piece "disappear."

There are quite a few repetitive steps in constructing this antenna that lend themselves to production line procedures: compression clamp assembly, element-to-boom bracket assembly, etc. This is where my young workers excelled. The manufacturer suggests that at least five hours be allowed for assembly, and though we weren't in a race, I believe we beat that figure by at least half an hour. One of my children remarked, "Don't worry, Dad, we'll have you on the air by tonight." (Visions of climbing towers by moonlight had overtaken me.)

Final assembly is simpler if you drive a temporary 5-foot length of mast into the ground and attach the boom and boom-to-mast brackets to it. This permits eye-level installation of...
parts and easy alignment of elements after assembly. This, naturally, is the best time to check and double-check all dimensions, (not when it's 100 feet in the air and 20° below zero).

I felt that there was a little too much play in the sleeve spacer clamping arrangement due to the use of 5/8-inch clamps — the next size smaller might have been better. Also, since no re-adjustment of element lengths and spacings ever called for, assembly would have proceeded even faster if the manufacturer had marked the boom and color-coded the element sections. But then again this additional step is easily done, and by leaving it to the assembler, the manufacturer probably keeps cost down.

installation

I had remarked earlier that the antenna was relatively light. To prove it, I mounted the Explorer 14 to a fifty-foot push-up TV mast. It withstood high winds and remained intact until disassembled several months later. I don't recommend TV mast installation to the timid — it takes some resolve and a bit of muscle. Mine settled at the 42-foot level with only a few feet overlap of mast sections and four sets of polypropylene guys. The manufacturer recommends that it be mounted at least 30 feet above roofs or metallic structures if a low VSWR is to be achieved. I agree completely. Normal tower mounting procedures and precautions are simply described in the manual.

performance

The antenna test "range" at K2RR in Milford, New Hampshire, consisted of at least one completely open acre with no other antennas or structures (metal or otherwise) closer than 1 1/2 wavelengths at the lowest operating frequency — 14.0 MHz. The Explorer 14 was mounted at 42 feet above a low conductivity ground (New Hampshire isn't called the Granite State for nothing). The antenna used for V-B comparison exhibited at least 1 dB gain over Europe at a fairly low angle (takeoff angle). A simple coaxial relay allowed for rapid comparison.

Initial tests involved verification of the manufacturer's VSWR specifications for the entire three bands. The test setup included a wattmeter and a SWR bridge (used separately). At the input to a 100-foot run of new 52-hm coaxial cable (Belden 8214), a VSWR of 0.1 was not exceeded at any frequency on 0, 15, or 20 meters and at many points was elow 1.5:1.

Both the gain and front-to-back evaluations were qualitative, unfortunately, but in all forward gain tests the received signal strength was greater from the Explorer 14 than from the reference antenna when both were aligned in the preferred direction. Since a bi-directional reference antenna was used, a rapid qualitative on-to-back evaluation was possible. Signals were weaker from off the back of the beam than from the standard antenna, as was expected. To provide accurate gain and F/B figures, a calibrated test setup and better knowledge of the reference antenna and site are required.

30 and 40-meter add-on

The Explorer 14 can be operated on 30 or 40 meters as well with the addition of the Hy-Gain OK-710 conversion kit. The add-on kit includes a 20-meter trap, additional tubing, stainless steel hardware, and another well-illustrated and written manual. Depending on which of the two kits you choose, the driven element assembly resonates on either 30 or 40 meters (besides 10, 15, and 20 meters). It adds 3.5 or 6 pounds, to the overall weight of the Explorer 14 using the 30 or 40 meter kit, respectively. It provides rotary dipole performance with the advantage of a single coaxial feed still only required for four band operation. (The add-on kit was not available at time of testing.)

field testing

In "field testing" the Explorer 14, I established a one-month goal to contact at least 100 countries during non-contest periods. It actually took only three weeks (June 18 - July 9).
new Hamtronics® catalog

The new 1984 Hamtronics mail order catalog of supplies for VHF/UHF/OSCAR enthusiasts and two-way radio shops is now available. This 36-page, two-color catalog features many new products, including an expanded line of FM repeaters and accessories such as power amplifiers, DTMF tone decoder/controllers, and autopatches. Also included are the popular lines of FM and AM receivers, FM transmitters, VHF and UHF transmitting and receiving converters, space shuttle receivers, 800 MHz scanner converters, preamps, and other products.

For a free copy, contact Hamtronics, Inc., 65F Moul Road, Hilton, New York 14468. (For overseas mailing, please send $2.00 or 4 IRCs.)

Circle #303 on Reader Service Card.
new handhelds

The new IC-02A and the IC-02AT two-meter handhelds are now available from ICOM. These compact multifunction handhelds are the same compact size as the IC-2A series, but have features found on no other Amateur handheld.

The IC-02A and the IC-02AT are designed to be compatible with all existing IC-2A accessories plus new accessories that will make them unique. An important feature of the IC-02A series is that it features 32 PL tones built into the unit as standard. These tones are programmable from the front panel pad, and may be used with any frequency selected, or may be stored in memory and recalled along with the frequency at any time.

Any frequency on 5 kHz spacing in the 2-meter ham band may be called up in the IC-02A. All frequency entries as well as control functions for memory, scanning, etc., are selected by the 16-button pad on the face of the radio. Included are priority watch, scanning of both memory and programmable band, and DTMF on the IC-02AT model. The unit features ten memories which store frequency, PL tone, offset and offset direction, and an internal lithium battery backup. The priority channel is a unique feature to the IC-02A and IC-02AT, as well as the custom LCD readout with an S-meter function, unique to the ham industry.

The IC-02A series will run at 3 watts with the standard BP3 battery pack, or at 5 watts with an optional high power battery pack. A long-life battery, 8.4 volts at 800 mA, will be available to double the working time of the standard 3-watt output unit. Batteries may be charged a variety of ways.

The IC-02A series has an environmentally sealed case with "O" ring seals to protect it from the elements.

with Transi-Trap™ Surge Protectors

Protect sensitive solid state and tube-type components from high-surge voltages produced by nearby lightning strikes, high wind and static build-up. Even distant storm fronts can cause damaging surges without warning or time for grounding.

Standard air-gap devices are ineffective due to their erratic performance. Transi-Trap's replaceable Arc-Plug™ cartridge utilizes a special ceramic gas-filled tube with precisely tailored firing speed and level, safely by-passing surges to ground. Fires thousands of times. Transi-Trap Protectors are the first devices in the industry designed with "isolated ground" — keeps damaging arc-energy off the chassis and routes it directly to ground.

Don't hook up your coax without one! The 200 W models are most sensitive, best for RCVRS and XCVRS. 2 kW models designed for amplifiers. For maximum protection use both, with 200 W model between XCVR and AMP. All models include Arc-Plug cartridge.

UHF "T-type" Connectors:

MODEL LT, UHF-type, 200 W output at 50 ohms
MODEL HT, UHF-type, 2 kW output at 50 ohms

Super Ruggedized Super Low Loss Models (0.1 dB at 500 MHz). For use with UHF/U HF, with UHF connectors:

MODEL RT, 200 W output at 50 ohms
MODEL HV, 2 kW output at 50 ohms

At your Alpha Delta dealer. Or order direct in U.S.: add $2 for postage and handling. MasterCard and VISA accepted. Ohio residents add Sales Tax.

See Data Sheet for surge limitations.

UP YOUR ERP

For HT owners operating inside a vehicle and wanting increased T/R range, RF PRODUCTS has the low cost solution.

Remove your BNC antenna from the HT and mount on the RF PRODUCTS BNC magnet mount. Install the magnet mount on the roof top and connect the BNC co-ax connector.

The magnet mount (part no. 199-445) has 10 feet of 5/32" co-ax with BNC connector attached and is priced at $15.95 (including shipping by UPS to 48 states).

TO ORDER - send $15.95 money order or cashiers check only. Fl. residents add 5% tax, for air UPS add $1.50.

The RF PRODUCTS Magnet Mounts are one of the few magnetic antenna mounts available that can be repaired should the co-ax cable be damaged. The co-ax cable connector includes a shrink tubing strain relief for long life at the connector/cable flex point (an RF PRODUCTS exclusive on all cable assemblies).

NEW! $12.95 pair

Yeah, Herb. I saw it advertised in Ham Radio Magazine this month.

ROHN
“FOLD-OVER” TOWERS

EASE OF INSTALLATION
ROHN “Fold-Over” Towers are quickly and easily installed. The “Fold-Over” is safe and easy to service.

ADAPTABLE
ROHN has several sizes to fit your applications or you can purchase the “Fold-Over” components to convert your ROHN tower into a “Fold-Over”.

HOT DIP GALVANIZED
All ROHN towers are hot dip galvanized after fabrication.

REPUTATION
ROHN is one of the leading tower manufacturers, with over 25 years of experience.

WARC bands kit for Yaesu FT-101

A new kit which provides receive/transmit capability on all three WARC bands for all models of the FT-101 except the ZD is now available from Fox Tango Corporation. While only the 10 MHz band has been authorized for use to date, little additional effort or expense will be needed to add all the bands while the circuit changes for 10 MHz are being made. In addition to making the old 101 ready when the new bands become available, the added capability increases the trade-in value of the set. Based on a tried and tested design by G3LLL, the WARC bands kit is complete with all needed crystals, relay, switch, and detailed instructions for moderately easy installation.

For further information, contact Fox Tango Corporation, Box 15944H, West Palm Beach, Florida 33416.

Circle #1307 on Reader Service Card.

mobile ATV module

P.C. Electronics has released a 1-watt AM UHF ATV transmitter module board (Model KP5A) which, when mounted in an aluminum box atop a portable color camera, allows the camera operator to move freely. Coverage of up to a mile is typical under most conditions; 50 miles has been done from an airplane. Applications include video from radio-controlled model airplanes or robots, computer video, base station remotes, weather radar video, or any application in which cables would be impractical.

The KP5A is a wired and tested board capable of full color and sound. It comes standard with one crystal on either 439.25 (east) 434.0 (west), or 426.25 MHz. Its power requirement

against dirt and moisture. A heavy-duty aluminum back provides heatsinking for the 2 watts of power. A power connector is supplied on the top of the unit. Twelve volts applied there will power the unit as well as charge the battery pack.

For further information, contact ICOM America, Inc., 2112 116th Avenue, N.E., Bellevue, Washington 98004.

Circle #306 on Reader Service Card.
is 13.8 VDC at 280 mA. The board size is only 4 x 3.25 inches (10.16 x 8.26 cm); its price is $159. Additional crystals are $16 each. Buyers must hold an Amateur license of Technician class or higher.

For further information, contact P.C. Electronics, 2522 Paxson Lane, Arcadia, California 91006.

three new adapters

Three new adapters designed to work with all DMM's having a 10 megohm or better DC input resistance and a 200 mV DC range are available from North American Soar. Model 9320, shown above, is a combination AC and DC current adapter complete with a clamp-

around Hall effect sensor. It can measure AC current to 150 amperes and DC current to 200 amperes without breaking into the line; it's priced at $79.00, with battery.

Model 9310 is a temperature adapter priced at $79.00, battery included. Switch-settable to read degrees in centigrade or Fahrenheit, it will work with all "K" type bimetal sensor probes.

solar systems
Photowatt International, Inc., a leading manufacturer of "total" solar electric systems, offers a laminated solar panel module rated at 55 watts, 16.5 volts at 3.4 amps that features 5-inch silicon cells. Other modules range in power from 7 watts to 35 watts are available. The Solar Eclipse Series modules have a power output of 7, 12, and 25 watts and are laminated in a durable bronze frame with charcoal gray Tedlar backing. Modules are wired for either 6 or 12-volt applications.

Photowatt also manufactures a photovoltaic regulator used for system control. These power control units are the only regulators that offer current and voltage meters, low-battery indicator, lightning protection, and additional components to protect the PV systems. The PCU's are in NEMA 3R, rain-tight, lockable enclosures. Ground and pole mount support frames are available for one to ten modules per structure. Batteries, wires, hardware, J-boxes, accessories and installation instructions are also supplied. Customized photovoltaic systems are available for immediate shipment.

For details, contact Photowatt International, Inc., 2414 West 14th Street, Tempe, Arizona 85281.

hand keys and keyer paddles
Guild, one of the most respected names in musical instruments and related electronics, recently became the sole distributor for the Hi-Mound line of iambic keyer paddles and hand keys.

Hi-Mound paddles feature silvered contacts with full spacing and tension adjustments on all
count on these

Two new series of turns-counting dials for panel control of precision potentiometers are now available from Beckman Electronic Technologies Group (BET). Ten new analog dials, series 2650 and 2660 Duodial™, are available in either the popular 1/16", 1/4", and 6 mm shaft sizes and are available with a clear or black anodized housing. They count up to 15 turns and are available in eight three- or four-digit models.

models. Three of the iambic paddles have heavy, slip-resistant bases (one of solid marble), while the fourth is a paddle assembly which can be mounted on the base of your choice or built into an existing keyer. The hand keys, in addition to retaining the classic look, also have silvered contacts and a unique tension adjusting system.

A clear plastic dust cover is included with each key, and all are protected by Hi-Mound's one-year warranty, backed by Guild.

For more information, contact Guild at 225 West Grand Street, Elizabeth, New Jersey 07202.

Circle F311 on Reader Service Card.

SSB/FM microphones

A new cardiod unidirectional microphone especially built for SSB and FM communications is available from Heil, Ltd.

Two models are available. The HM-5 features a die-cast metal base and heavy-duty flexible goose-neck stand. The MM-5 is a comfortable hand-held unit for use in mobile or fixed operations.

Both feature Heil's new HC-3 cartridge and offer enhanced intelligibility and articulation and clean, natural reproduction of voice transmissions. Sensitivity is measured to -70 dB; response, 300-4000 Hz; impedance, 2000 ohms.

For more information, contact Heil, Ltd., Marissa, Illinois 62257.

Circle 1312 on Reader Service Card.
Both series feature a positive locking mechanism that prevents accidental changes due to shock or vibration. They mount directly on the potentiometer shaft to prevent backlash and are designed to complement the Beckman Helipot® potentiometer.

new cable

Nemal Electronics has just introduced a new cable for both the home and commercial satellite TV market. This new cable eliminates the separate control and RF cables and bundles them together into a single easy-to-handle covered package. Nemal’s new SCC-92189 cable is covered with a high-strength, non-corroding vinyl outer jacket suitable for either direct burial or laying on the ground. Inside is one Mil-Spec RG-59 RF cable with a high copper braid shield. There are four No. 22 copper strand wires and two No. 2 wires that are shielded with a drain for sensitive signal activator circuits. Finally, two heavy-duty No. 18 wires are included for remote control. By eliminating the number of separate wires, the chances of accidental system damage are reduced. Installation time is also reduced because of the ease and convenience of running one cable rather than several. The price is tentatively set at 75 cents per foot and $495.00 per thousand feet.

For more information, contact Nemal Electronics, 12240 NE 14th Avenue, North Miami, Florida 33161.

Circle #314 on Reader Service Card.
new MOS for 150 MHz power amplifiers

Motorola has introduced an extensive new line of RF Power MOSFETs offering output power in the range of 5 watts to 125 watts at 150 MHz. Manufactured with TMOS technology, these devices are designed for 28 volts operation in VHF amplifiers, with a range of 9 to 13 dB minimum gain. The devices are designated MRF134, MRF136, MRF171, MRF172, and MRF174.

These new TMOS devices exhibit higher gain, high input impedance, lower noise figure and lower-intermodulation distortion than bipolar devices. This helps improve the performance of amplifying circuits and, in some cases, lowers the overall cost by requiring fewer stages of amplification.

6-meter amplifier

Mirage Communications has recently been granted FCC type acceptance on their new 6-meter amplifier, the A1015. The solid-state unit is rated at 150 watts out for 10 watts in and comes with a list of features that includes a built-in receiver pre-amp, “all mode operation” (FM, SSB, and CW) and antenna changeover capabilities.

Designed to fill the growing demand for a 6-meter amplifier compatible with a variety of different 10-watt radios now in use, the unit sells for $279.95.

For more information, contact Everett Gracey, Mirage Communications, P.O. Box 1393, Gilroy, California 95020.

Complete TVRO System
With 10 foot Parabolic Antenna

$1395

Item No. SAT44311
Shipped Motor Freight Collect

What the system will do:
Receives up to 60 satellite TV channels including movies, sporting events, news, other TV stations and much more!

What the system includes:
1. 10 ft. parabolic antenna made of reflective metal bonded with fiberglass. Breaks down into 4 sections for compact shipment.
2. Polar mount. Features azimuth and elevation adjustments for precise tracking. Available with earth or slab mounts.
3. LNA mount complete with rotor. Enables LNA to be remotely positioned for correct polarity. Control console included. Extension tubes extra.
4. KLM Sky Eye V satellite receiver. Features the latest in single conversion electronics, large signal strength meter, video invert and variable audio tuning. Downconverter and built-in RF modulator included.
6. Scalar feed horn. Provides 0.5 dB more gain than conventional types. Virtually eliminates system noise.

NOTE: LNA-to-downconverter cable included. Other interconnecting cables between components sold separately.

NOTE: Prices good only while current supply lasts. Price subject to change without notice. Hurry, quantities are limited!

Please use before February 29, 1984

January 1984
MOSFET technology in American made mobile power amplifiers. Built for those who demand quality.

4101 Complete 2 meter HT accessory—All mode RF amplifier, 2W in = 25W out, 50W out maximum; regulated power supply for HT; 4W speaker amplifier; optional RX preamplifier $215

4102 Complete 2 meter HT accessory—All mode RF amplifier, 2W in = 100W out; regulated power supply for HT; 4W speaker amplifier; optional RX preamplifier. $325

4103 All mode 100W 2 meter amplifier—For 1W to 25W transceivers. 2W in = 30W out, 10W in = 90W out. Optional RX preamp. $225

4104 All mode 100W 220 MHz amplifier—For 1W to 25W transceivers. 2W in = 25W out, 10W in = 70W out. Optional RX preamp. $235

4105 Amplifier remote control—Controls 4103 or 4104 amplifiers mounted away from operating position. Complete with 16' cable. $32

4109 2 meter RX preamp—Plugs in to a Falcon 2 meter amplifier. $36

4110 220 MHz RX preamp—Plugs in to a Falcon 220 MHz amplifier. $39

Coming Next Month

4116 2 meter receiver preamp—For improving receiver sensitivity of transceivers. Switches out on transmit. No transceiver modification.

4117 Twin 40 dB RF coupler—Two attenuators bridge a thru line. Connect signal generators, spectrum analyzers, etc., without the fear of accidental damage from transmitter power.

4118X Splice Kote—Heat shrink tubing with special thermo-plastic inner coating. Weather seals coaxial fittings.

And you can see it—in color—again and again
when you own the N2NY Ham MasterTapes.

Ever see a cap discharge in slow motion? You will on
Ham MasterTapes. Ham MasterTapes can perform the
dozens of complicated demonstrations necessary for a
beginner's understanding of Ham Radio Theory.

Finally, a step-by-step course in Ham Radio Theory
is available on color videotape. The Larry Horne N2NY
Ham MasterTapes video course is a unique, effective
teaching technique expertly produced by New York's
leading professionals in studio and field videotape.

Video Graphics highlight important details.
Carefully worked-out demonstrations on video avoid
the problem of getting complex gadgets to work on
command in front of a class.

Working examples of every ham
radio component, device, or system
covered in the FCC guide can be
clearly understood.

The N2NY Ham MasterTapes give you a basic
grasp of concepts that build theory background—not
only for passing the FCC tests, but for understanding
electronics.

The hobby has long needed better, clearer, high-
tech teaching aids to help newcomers into our wonder-
ful world of Ham Radio.

These six-hour tapes cover completely all the ma-
terial needed to understand Novice and Tech/General
Theory and operations, and include the new 200-ques-
tion FCC syllabus used beginning September 1983.

Only $199.95. Order direct and specify Beta or VHS
format. Call or write: Larry Horne, N2NY or
Virginia Hamilton, N2EGJ at
Ham MasterTapes

INTRODUCING . . .

THE FT-980 CAT SYSTEM !!!

Join the computer revolution in Amateur Radio with the Computer Aided Transceiver . . . the new FT-980 from Yaesu Electronics!

- 8-Bit microprocessor for greater operating flexibility.
- High-voltage, all solid state transmitter PA for excellent linearity.
- Keyboard entry of frequencies into any of twelve independent VFO/memory registers.
- Amateur band transmit plus general coverage receive capability.
- Full CW break-in with quiet solid state switching.
- CW Spot switch on front panel.
- Digital frequency display with resolution to 10 Hz. Digital readerboard-type coarse frequency sub-display.
- Keyboard entry of sub-bands for Novice, General, or Advanced Class operators. Separate sub-bands may be programmed on each memory.
- Up/Down scanning plus instant ±5 kHz/step QSY from front panel.
- SSB/CW/AM/FSK/FM operation built in. CW and AM Wide/ Narrow selection using optional filters.
- Wide dynamic range and noise floor maintenance provided by husky front end design and IF filter gain balancing.
- 10 Hz synthesizer steps. Quick frequency change via keyboard or scanning controls.
- IF Notch filter at 455 kHz for interference rejection.
- Audio Peak Fiter for narrow band CW signal enhancement.
- RX Audio Tone Control for signal laundering in AF line.
- Variable IF Bandwidth and IF Shift using cascaded filters.
- Memory storage of both frequency and operating mode.
- Pushbutton Memory Check feature for verification of memory frequencies without actually changing operating frequency in use.
- Pushbutton Offset Check feature for verification of memory-to-VFO frequency difference.
- Variable Pulse Width Noise Blanker.
- IF Monitor with front panel volume control.
- RF Spe& Processor.
- Dual metering of Vcc, Ic, ALC, Compression, Discriminator Center, Relative PO, and SWR (Calibrated).
- Selectable AGC: Slow/Fast/Off.
- Separate RX-only antenna jack.
- Three FSK shifts built in.
- Optional Electronic Keyer Module.
- Optimization of audio passband for mode in use, for preservation of noise figure with changing bandwidth.
- Computer interface optional module available mid-1983, for remote transceiver control from personal computer terminal.

For a detailed brochure covering the FT-980 CAT System, call or write your Authorized Yaesu Dealer.
Watts to see...

Big LCD, Big 45 W, Big 21 memories, compact.

TR-7950/7930

Outstanding features providing maximum ease of operation include a large, easy-to-read (direct sunlight or dark) LCD display. 21 multi-function memories, automatic offset, programmable priority channel, memory and band scans, built-in lithium battery memory back-up, built-in 16-key autopatch encoder, and a choice of a hefty 45 watts output (TR-7950), or 25 watts output (TR-7930).

TR-7950/7930 FEATURES:

- NEW, large, easy-to-read LCD digital display
  Easy to read in direct sunlight or dark (back lighted). Displays transmit/receive frequencies, memory channel, repeater offset, +S-D, sub-tone number IF-1, 1, 2, 3I, tone, scan, and memory scan lockout. Includes LED S-RF bar meter, and LED indicators for REVERSE, CENTER TUNING, PRIORITY, and ON AIR.

- 21 NEW, multi-function memory channels
  Stores frequency, repeater offset, and optional sub-tone channels. Memories 1 through 15 for simplex or ± 600 kHz offset. Memory pairs 16/17, and 18/19 are paired for non-standard repeater offset. Memories “A” and “B” set upper and lower scan limits, or for simplex or ± 600 kHz offset. In MEMORY mode, a circle of light appears around the memory selector knob. When the memory selector knob is rotated in either direction to channel 1, an audible “beep” will sound.

- Choice of 45 or 25 watts output
  The TR-7950 provides a hefty 45 watts output, while the TR-7930 features a more modest 25 watts. A Hi/LOW power switch allows power reduction to approx. 5 watts.

- Long-life lithium battery memory back-up
  Built-in lithium battery has an estimated 5 year life.

- Automatic offset
  The microprocessor is pre-programmed for simplex or ± 600 kHz offset. In accordance with the 2 meter band plan, “OS” key allows manual change in offset.

- Programmable priority alert
  The PRIORITY channel may be programmed in any of the 21 memories. With ALERT switch “ON,” a dual “beep” sounds when a signal is present on the PRIORITY channel. An OPER switch allows an easy move to the PRIORITY channel.

- Programmable memory scan lock-out
  “LO” key for programming scan to skip selected memory channels, without erasing the memory.

- Programmable band-scan width
  The lower limit may be programmed into memory “A,” and the upper limit into memory “B.”

- Center stop during band-scan, with indicator
  Stops in center of channel during band-scan, with center tuning indicator.

- Scan resume selectable
  Scan stops on busy channel. Selectable automatic time resume scan lapprox. 5 sec., adjustable, or carrier operated resume scan. A scan delay of approx. 1.5 seconds built-in.

- Scan control using up/down microphone
  Momentarily pressing UP or DOWN button on microphone times one step in the selected direction, on memory or on 5 kHz step tuning. Holding the button for about 2 seconds starts UP or DOWN automatic scan action. Scan start also possible using “SC” key on keyboard. Scan may be cancelled by momentarily pressing the PTT switch, or by pressing both UP/DOWN buttons simultaneously.

- Programmable sub-tone channels
  Optional TU-793 frequency sub-tone unit provides keyboard selectable sub-tone channels, which may be stored in memory.

- Built-in 16-key autopatch. with monitor
  The keyboard functions as a 16-key autopatch encoder during transmit. DTMF tones apppar in the speaker output when a key is pressed during transmit.

- Front panel keyboard control
  Used for selecting frequency, offset, programming memories, controlling scan, and autopatch encode. Keyboard lighting is provided.

- Extended frequency coverage
  Covers 142.000-148.995 MHz, in 5-kHz steps.

- Repeater reverse switch
  Locking-type switch, with indicator.

- “Beep” amplified through speaker

- Compact, lightweight design

- Easy-to-install adjustable-angle mobile mounting bracket

Optional accessories:

- TU-79 three frequency tone unit.
- KPS 12 fixed-station power supply for TR-7950.
- KPS 7A fixed-station power supply for TR-7930.
- SP-40 compact mobile speaker.

More information on the TR-7950 and TR-7930 is available from all authorized dealers of Trio-Kenwood Communications, 111 West Walnut Street, Compton, California 90220.
